It was our great pleasure to be involved and work in a real life project. Our thesis topic is “Developing test cases for RJSC’s computerization process”.

We would like to extend our sincere thank to Mr. Matin Saad Abdullah, Lecturer, CSE Dept. BRAC University, Dhaka for his valuable support to fulfill our academic assignment. Also we honor his immense contribution throughout the process of study. His contribution in the preparation of the concept paper, literature, methodology and writing this report is highly acknowledged.

We are also thankful to our task leader Mr.K.D Roy for his helpful assistance.

Finally, we would like to extend our appreciation to all BRAC University friends, course mates and study partners for their support and co-operation.

Abstract

This report is based on the project “Computerization of the Office of Registrar Joint Stock Companies and Firms”. Our client is South Asia Enterprise Development Facility (SEDF) and the system owner is Registrar of Joint Stock Companies and Firms (RJSC). We worked for Development Design Consultants Ltd (DDC) and generated use cases and test cases for RJSC’s computerization process. According to RJSC’s Business Process, The main activities of RJSC are as follows:

- Issuance of Name Clearance Certificate
- New Company Registration
- Returns Filing
- Issuance of Certified Copies of the Documents

Each activity module is divided into different sub processes. In our project we generated 42 use cases and corresponding test cases. As tester our main objective was to determine that the user requirement is fulfilled, determine that the needs have been defined and documented, verify that a reasonable process was followed, determine consistency with design and adequacy of design.

Chapter 1: Introduction

Software testing is very important in software development process. It is better to start testing as early in the software development process as possible. Delaying the start of testing activities until all development is done is a high-risk way to proceed. If significant bugs are found at that stage (and they usually are), then schedules often slip. It is not an easy job to do testing. First, testing software is a very difficult proposition; and second, testing is typically done without a clear methodology.

Haphazard methods of designing, organizing, and implementing testing activities and artifact also frequently lead to less-than-adequate test coverage. Having a straightforward plan for how testing is done can help increase coverage, efficiency, and ultimately software quality.

We work as a tester for the company Development Design Consultants Ltd. (DDCl). We work on the project “Computerization of the Office of Registrar Joint Stock Companies and Firms”. RJSC is government authority to keep record of all Firms and companies. According to RJSC’s business process, RJSC perform four main tasks.

- Name clearance Module
- Registration Module
- Returns Filing Module
- Issuance of Certified Copies Module

We develop UML for each subsystem. Use cases are basically based on unified modeling language. With the help of UML and design diagram use cases are generated. As soon use cases are developed, test cases are generated for each use case.

As a tester our main objective was to determine that the user requirement is fulfilled, determine that the needs have been defined and documented, Verify that a reasonable process was followed, determine consistency with design and adequacy of design.
2.1 Project Information

Development Design Consultants Limited (DDC), the Consultant has been awarded with the Contract by South Asia Enterprise Development Facility (SEDF) for the project named ‘Computerization of the Office of Registrar Joint Stock Companies and Firms’.

The Registrar of Joint Stock Companies and Firms (RJSC) is the sole authority that facilitates company formation for public & private companies, foreign companies, partnerships, trade organization and societies and keeps track of all ownership-related issues as prescribed by the laws in Bangladesh.

The objective of this project is to automate all functions of the Registrar of Joint Stock Companies and Firms, Dhaka as well as other divisional offices at Chittagong, Khulna and Rajshahi.

Computerization of RJSC will reduce the time necessary for company registration, increase the efficiency of the office of the RJSC, and allow more accurate and efficient provision of information about the registration and filing processes and about registered companies in Bangladesh. The automation will allow the RJSC to monitor the compliance with regulatory reporting requirements and ownership reporting. The impact will be a more conducive environment for business registration and a stronger system of corporate governance compliance, which will assist in the growth of a healthy private sector.
2.2 Overall System Architecture:

Each divisional office and head office of RJSC will be powered by a separate database server and an application server. A web server and a mail server will be set up at head office only. Each Divisional Office will be connected to the head office through fiber optics or DDN and the head office will be connected to the internet through an ISP.
2.3 Client Background:

The Registrar of Joint Stock Companies and Firms (RJSC) is the sole authority, which facilitates company formation for public companies and partnerships and keeps track of all ownership-related issues as prescribed by law in Bangladesh.

RJSC operates under the Ministry of Commerce, Government of the People’s Republic of Bangladesh. The office was first setup at Chittagong in erstwhile East Pakistan at the eve of partition of India in 1947 with a small number of records and files of the company, society and partnership firms. The office was shifted to Dhaka in 1962. The numbers of incorporated companies are increasing day by day.

The total number of incorporated companies, societies, trade organizations, and partnership firms up to December 2004 is 101,000. The head office of the RJSC is situated at 24-25, Dilkusa C/A, Dhaka in a rented accommodation. The total approved manpower for the office is 39.

There are three divisional office in Chittagong, Khulna and Rajshahi with 8 employees in each office and headed by an assistant registrar. These offices are functioning under the central administration of the registrar.

In short the functions and activities of the office is to incorporate the company, society and partnership firms under the companies act, 1994, Societies Registration Act, 1860 and partnership Act 1932 respectively and administer and enforce the relevant statutory provisions of those acts in relation to the incorporated companies, societies and partnership firms in the country.

Chapter 3: Background Information
### Purpose of the Use case:

A use case captures a contract between the stakeholders of a system about its behavior. The use case describes the system's behavior under various conditions as it responds to a request from one of the stakeholders, called the primary actor. The primary actor initiates an interaction with the system to accomplish some goal. The system responds, protecting the interests of all the stakeholders. Different sequences of behavior, or scenarios, can unfold, depending on the particular requests made and conditions surrounding the requests. The use case collects together those different scenarios.

Use cases are fundamentally a text form, although they can be written using flow charts, sequence charts, Petri nets, or programming languages. Under normal circumstances, they serve to communicate from one person to another, often to people with no special training. Simple text is, therefore, usually the best choice.

The use case, as a form of writing, can be put into service to stimulate discussion within a team about an upcoming system. They might later use that the use case form to document the actual requirements. Another team might later document the final design with the same use case form. They might do this for a system as large as an entire company, or as small as a piece of a software application program. What is interesting is that the same basic rules of writing apply to all these different situations, even though the people will write with different amounts of rigor, at different levels of technical detail.

Use cases are based on the Unified Modeling Language (UML) and can be Visually represented in use-case diagrams.
Example of a Use case diagram for a University registration process:

When the use cases document an organization’s business processes, the system under discussion is the organization itself. The stakeholders are the company shareholders, customers, vendors, and government regulatory agencies. The primary actors will include the company’s customers and perhaps their suppliers. When the use cases record behavioral requirements for a piece of software, the system under discussion is the computer program. The stakeholders are the people who use the program, the Company owning it, government regulatory agencies, and other computer programs. The primary actor will be the user sitting at the computer screen or another computer system.
3.2 Implementation of Use Case:

The most important part of a use case for generating test cases is the flow of events. The two main parts of the flow of events are the basic flow of events and the alternate flows of events. The basic flow of events should cover what "normally" happens when the use case is performed. The alternate flows of events covers behavior of an optional or exceptional character relative to normal behavior, and also variations of the normal behavior.

Figure: Basic Flows of events and alternative Flows of events for a Use case
Use cases are a form of writing that can be put to use in different situations, to describe

- A business' work process,
- To focus discussion about upcoming software system requirements, but not be the requirements description,
- To be the functional requirements for a system, or
- To document the design of the system.

They might be written in a small, close-knit group, or in a formal setting, or in a large or distributed group.

Each situation calls for a slightly different writing style. They are briefly described here:

- A close-knit group gathering requirements, or a larger group discussing upcoming requirements will write **casual** as opposed to the **fully dressed** use cases written by larger, geographically distributed or formally inclined teams. The casual form "short circuits" the use case template, making the use cases faster to write (see more on this below). All of the use cases shown above are fully dressed, using the full use case template and step numbering scheme.

- Business process people will write **business** use cases to describe the operations of their business, while a hardware or software development team will write **external, system** use cases for their requirements. The design team may write **internal, system** use cases to document their design or to break down the requirements for small subsystems.
• Depending on the level of view needed at the time, the writer will choose to describe a multisitting or summary goal, a single-sitting or user goal, or a part of a user goal, or sub function.

• Anyone writing requirements for a new system to be designed, whether business process or computer system, will write black-box use cases - use cases that do not discuss the insides of the system. Business process designers will write white-box use cases, showing how the company or organization runs its internal processes. The technical development team might do the same to document the operational context for the system they are about to design, and they might write white-box use cases to document the workings of the system they just designed.

In current practice, use cases are associated with the front end of the software development lifecycle and use case scenarios are used as the basis for creating test cases.

3.3 Purpose of the Test Case:
A test case is a set of test inputs, execution conditions, and expected results developed for a particular objective: to exercise a particular program path or verify compliance with a specific requirement, for example.

The purpose of a test case is to identify and communicate conditions that will be implemented in test. Test cases are necessary to verify successful and acceptable implementation of the product requirements (use cases).

We will describe a three-step process for generating test cases from a fully detailed use case:
1. For each use case, generate a full set of use-case scenarios.
2. For each scenario, identify at least one test case and the conditions that will make it "execute."
3. For each test case, identify the data values with which to test.

These steps are described below:

**Step One:** Generate Scenarios
To generate test case at first Read the use-case textual description and identify each combination of main and alternate flows, the scenarios and create a scenario matrix.

**Step Two:** Identify Test Cases
Once the full set of scenarios has been identified, the next step is to identify the test cases. We can do this by analyzing the scenarios and reviewing the use case textual description as well. There should be at least one test case for each scenario, but there will probably be more.
For example, if the textual description for an alternate flow is written in a very cursory way, like the description below,
3A. Unfulfilled Prerequisites, Course Full, or Schedule Conflicts
then additional test cases may be required to test all the possibilities. In addition, we may wish to add test cases to test boundary conditions. The next step in fleshing out the test cases is to reread the use-case textual description and find the conditions or data elements required to execute the various scenarios.

**Step Three: Identify Data Values to Test**
Once all of the test cases have been identified, they should be reviewed and validated to ensure accuracy and to identify redundant or missing test cases. Then, once they are approved, the final step is to substitute actual data values for the Is and Vs. Without test data, test cases (or test procedures) can’t be implemented or executed; they are just descriptions of conditions, scenarios, and paths. Therefore, it is necessary to identify actual values to be used in implementing the final tests.

In current practice, use cases are associated with the front end of the software development lifecycle and test cases are typically associated with the latter part of the lifecycle. By leveraging use cases to generate test cases, however, testing teams can get started much earlier in the lifecycle, allowing them to identify and repair defects that would be very costly to fix later, ship on time, and ensure that the system will work reliably. Using the clearly defined methodology that is described above for generating test cases, developers can simplify the testing process, increase efficiency, and help ensure complete test coverage.
4.1 Steps In Generating Test Cases

4.2 Design Diagram of Name Clearance Module
Start

Select Name Clearance Application

New Clearance?

Yes

Name search required?

No

Fill in the forms

Name clear?

Yes

Select Payment Method

Reserve proposed names for 24 hrs

Generate receipt with track number and filled up forms

Process email and web notification

a

No

Search name

Pay online?

Yes

Authenticate by credit card or prepaid card

Authentic?

Yes

Check for document submission period

Process online payment

b

No

Select for time extension

Check authenticity of application

Application authentic?

Date within 30 days from issuance and time not extended before?

Yes

Notify online

Make Decision on time extension

c

Continued…
Continued…

1. Reserve approved name for 30 days
2. Cancel reservation for rest of the proposed names
3. Issue digital copy?
   - Yes: Generate softcopy certificate with digital signature
   - No: Generate hardcopy certificate
4. Process e-mail and web notification
5. Commit issuance of certificate
6. End
4.3 UML Of Name Clearance Module

![UML Diagram of Name Clearance Module]

- **Promoter**
- **Computer Operator**
- **Deputy Registrar**
- **Dealing Officer, Counter**
- **Registrar**
- **Dealing Officer, Certificate**
4.4 Use Case Of Apply For Name Clearance

**UC1: Apply for name clearance.**

**Primary Actor:** promoter.

**Stakeholders and interest:**

Promoter: wants accurate, fast search and get the receipt successfully.
RJSC: wants successful completion of name clearance process.

**Post condition:** Receipt has been generated successfully. E-mail has been sent and acknowledged and accordingly web notification sent.

**Basic Flow:**

1. Promoter browses to RJSC’s web site.
2. Promoter selects name clearance application.
3. Name search is not required.
4. System displays the name clearance form.
5. Promoter enters name, address, three alternative company name and type the e-mail address twice.
6. Promoter completes filling up the form.
7. System shows a validation message.
9. System reserves valid name for 24-hours.
10. System shows a reservation message.
11. System generates receipt with track number.
12. Receipt is printed.
13. System sends an e-mail and web notification to the promoter.
Extensions:

*a. At any time system fails:
To ensure recovery, the system should have back-up storage.

3a. Name search is required:
1. Promoter searches for existing names in RJSC’s website.

5a. Company names are not valid:
1. System shows a message to re-enter the company names.

5b. Invalid e-mail address:
1. System requests to enter the valid e-mail address.

5c. Two e-mail address does not match:
1. System shows a message to check the e-mail address.

5d. Promoter uses special character in the name:
1. System shows an error message.

5e. Promoter does not enter any company name:
1. System shows a requesting message to enter at least one company name.

9a. Payment is not done within 24-hours:
1. Reservation will be deleted automatically.
2. E-mail will be sent to the promoter to inform that the name reservation has been canceled.

12a. Receipt is not printed.
1. System shows a warning message.

13a. Promoter does not get the confirmation e-mail and web notification
1. Current form is canceled.
2. Promoter has to redo the process.
### 4.5 Test Case Of Apply For Name Clearance

APPENDIX
Name Clearance Module

UC2: Apply for time extension.

Primary Actor: Promoter.

Stakeholders and Interests:

Promoter: Wants successful completion of time extension.

Preconditions: Promoter's name must be present in RJSC’s database

Post condition: Request for time extension is granted

Basic Flow:

1. Promoter goes to RJSC’s website.
2. Select name clearance application.
3. Apply for time extension.
4. System checks for authentication.
5. System checks that the time extension application is done within ten days from the day of name issuance.
6. System checks whether the promoter has applied for time extension before.
7. System grants time extension request.
8. System sends an e-mail to the promoter.
9. System extends name validity for 30 more days.

Extension:

*a. System fails at any time:*
- To ensure recovery, system must have a back-up storage.

4.1. System finds authentication failure:
- System shows an authentication failure message.

5.1. Time extension application is not done within 30 days from name issuance:
- System displays that the time for time extension application is over.

6.1 Promoter has applied for time extension before:
- System displays an authentication failure message.

7.1. System has not granted time extension request:
- System automatically terminates.
**Test Case of Apply for time extension.**

UC3: Accept Payment.

Primary Actor: Dealing Officer.

Stakeholders & interests:
Dealing Officer: Wants to receive payments successfully.
Promoter: Wants to pay the amount successfully.

Precondition: Dealing Officer must be authenticated.
Post condition: Receipt will be generated successfully.

Main Success Scenario:
1. Dealing Officer logs in.
2. Enter receipt number into system.
3. System checks the receipt number.
4. Dealing Officer enters amount paid.
5. System generates printable receipt.
6. Dealing Officer gives print command.
7. Receipt is printed.

Extension:
3.a. Receipt number does not match.
   1. System shows an error message.
   2. Reenters receipt number.
7.a. Receipt has not printed.
   1. System shows a warning message.

**UC4: Accept Document.**

Primary Actor: Dealing Officer.

Stakeholders & interests:
Dealing Officer: Wants to receive documents successfully.
Promoter: Wants successful processing of the documents.

Precondition: Dealing Officer must be authenticated.
Post condition: Document will be generated successfully.

Main Success Scenario:
1. Dealing Officer logs in.
2. Enter document submission receipt number into system.
3. System checks the receipt number.
4. Dealing Officer marks document submission by promoter.
5. Dealing Officer write comment.
7. System generates document submission receipt.
8. System reserves name until decision.

Extension:
3.a. Receipt number does not match.
1. System shows an error message.
2. Reenters receipt number.
7.a. Receipt has not printed.
1. System shows a warning message.

Registration Module

**UC1: Apply For Registration.**
Primary Actor: Promoter.
Stakeholder And Interest:
Promoter: Wants successful registration.

Precondition: Promoter has completed name clearance procedure.
Postcondition: Receipt has been generated successfully.

Main Success scenario:
1. Promoter logs in.
2. Visit the registration page.
3. System verifies name.
4. System shows a validation message.
5. Promoter asks for registration form.
6. System displays the registration form.
7. Promoter fills up the registration form.
8. Promoter completes filling up the form.
9. System shows a validation message.
11. System generates receipt with track number.

Extension:
*a. At any time system fails:*
To ensure recovery, the system should have back-up storage.
3. a. Name is not valid.
1. System shows an error message.

Issuance Of Certified Copies Module

**UC1: Apply for Certified copies.**
Primary Actor: Client

Stakeholders and interests:
Client: Wants to get the certified copies.
Copyist: Wants to check the documents in the approved manner.
Deputy Registrar: Wants errorless document from the Copyist.

Preconditions: Client must be registered.
Postconditions: Certified copies are generated successfully. Client gets the certified copies.

Basic Flow:
1. Client browses to the RJSC’s web site.
2. Selects application form from the web site to apply for certified copies.
3. Fills up the form by mentioning type of the document.
4. Submits the application form.
5. Exits from the web site.

Extensions:
3.a. Document type does not match.
   1. System shows a message to re-type the document type.
3.b. Blank in the submitted application form.
   1. System shows a message to fill up all the blanks.
3.c. Document does not exist.
   1. Client prepares the document.
   2. Submits the document.
   3. Apply for certified copies.
4.a. Application form could not be submitted.
   1. Rejects all the entry.
   2. Client goes back to the beginning and completes the whole process.
