Declaration

I hereby declare that I am the sole author of this thesis.

I authorize the Institute of Governance Studies (IGS) and BRAC University to lend this thesis to other Institutions or individuals for the purpose of scholarly research only.

I further authorize the IGS and BRAC University to reproduce this thesis by photocopying or by other means, in total or in part, at the request of other institutions for the purpose of scholarly research.

Mohammad Moniruzzaman Bakaul

MAGD Batch- 5

IGS, BRAC University

Dedicated to my family who encouraged me to carry on the research

Acknowledgement

The author is greatly indebted to the following individuals and institutions who assisted and contributed their valuable advice, time and support to help field work, prepare writing and share their experiences and perspectives on land zoning and changing land use pattern in the study area.

--Dr. Nasiruddin Ahmed, Professor and supervisor of BRAC University, who supervised, advised and guided intensively and enthusiastically from the inception of this research. His discussions and suggestions were very inspiring and finally shaped my ideas to carry out the study. I am highly indebted to him for his invaluable advice and intellectual guidance throughout my dissertation writing.

--Dr. Rizwan Khair, Director, IGS, to enrich me with his profound advice and valuable guidelines regarding smooth completion of the study.

-The project director and staffs of land zoning project for providing basic information of land uses, classes and suitability's of land and activities of land zoning project for the research.

--The head of DLSO, UAO, UFO, USO, ULO, UA of Brahmanbaria and DGLR who provided ground data and related information for analysis the research.

--The Soil Research and Development Institute (SRDI) of Bangladesh which provided soil data.

--The local stakeholders and KII whose comments, advice and suggestions guided for shaping the research design and interpretation

-- My loving family for their forbearance, inspirations, sacrifices, blessings and never ending encouragement.

Abstract

Bangladesh is one of the most densely populated country in the world. With the growing population, and their rising needs in diverse sectors, land use patterns are undergoing a quantitative and qualitative change in which the areas under the net cultivable land, water bodies and forest land is gradually shrinking. Besides, unplanned infrastructure development is devouring productive land. In Bangladesh, about 1% of agricultural land in each year is transferred to another use (SFYP, 2011). If this process continues, all of our agricultural land would diminish within 100 years (Tariquzzaman, 2009). This terrible situation is very crucial for an agro-based economy. The Ministry of Land formulated a National Land Use Policy in 2001 to ensure best possible use of land resources for sustainable development. The policy highlighted the need for carrying out a National Land Zoning Program for integrated planning and management of the country's land resources. Planned use of land according to Land Zoning Maps prepared on the basis of present and potential land uses will be ensured through enforcement of the provisions of relevant laws. The current research is an attempt to study the pattern of land use change and agricultural land transformation at Charchatla union in Asuganj Upazila, Brahmanbaria. The research also analyzed the land zoning process and established a logical approach for saving cultivable land, planned land use and systematic development. Compulsory Efficient Use of Land (CEUL) is the most accountable and feasible systematic approach for favorable land use and planned land zone in Bangladesh. CUEL is related to various quantitative and qualitative aspects of land resource. Holding different cartographic information, CUEL facilitates capturing, retrieval, and querying of information and provides tools to perform different analyses. Based on the primary and secondary data, this research is aimed at studying the synchronization and diachronization of land use pattern, and recommending feasible interventions and strategy of CUEL for creating an efficient and planned land use policy for Bangladesh.

Chapter -1

1.1 Introduction

Land is the father of wealth and labor is her mother (Barkat, 2007). It is resource and not commodity (Sinclair, 2002). As a wealth land is scarce, finite, immovable, productive and decisive in determining individual's economic status, social standing and political strength. It is not only providing support for economic development, poverty alleviation, food and social security but also ensure human settlement, environmental protection, peace, social harmony and social justice. All these are relevant in the case of Bangladesh, a densely populated and predominantly agrarian country. Consequently land management issues have received national attention. Land is more vulnerable natural resource and it is easily affected human factors. Land misuse and mismanagement can be derived from human factors in many ways, such, over population, unplanned use, over usages, unplanned habitation and unplanned cultivation. However, the present land use policy of Bangladesh cannot meet the growing demand and changing situation of land features. Improper land use policy and strategy is the cause for unplanned land use, and this eventually generates problems in the rural and urban life. Day by day, decreasing nature of cultivated land has been creating tension for Bangladeshi's people. The government of Bangladesh prepared National Land Use Policy (NLUP) in 2001. The NLUP highlights significance and modalities of land zoning for integrated planning and management of land resources of the country. It also focused on formulating a Zoning Law and Village Improvement Act for implementing land zoning (Land Use Poliocy 2001). Lack of effective implementation and competent management, the policy didn't see the sunlight for her beneficiaries. It is needless to say that the optimum and effective use of land is the country's priority to manage her resources (MOL, 2011). For this, it is a longstanding demand to establish a compatible land use system in this country with a holistic approach. Compatible and efficient use of land is inevitable for Bangladesh with the trends population, urbanization, industrialization and changes in climatic conditions. There are many approaches and ways are utilizing for land use efficiently. However, feasibility and affordability of approaches are the important aspects for choosing any approach. With these regard, Compulsory Efficient Use of Land (CEUL) is the most feasible systematic approach for developing adequate land use for

sustainable development of Bangladesh. This paper has focused on the issues that are involved in formulating a compatible land use policy for the planned and development of Bangladesh.

1.2 Identification of the problem

Though land is the sole property for livelihood and all types of development depends on these intangible resources, every day her contamination, destruction and reduction affect on character, structure, quality and capacity. Rapid population increase is the significant challenge of efficient and compatible use of land. In this country, 155 million people live in 147,750 sq. km (Ahmad, 2012) where the land-man ratio is 0.14 hectares and about 1% of agricultural land in each year is transferred to another use (Tariquzzaman, 2009). The per capita availability of land is declining and the loss of agricultural land is going on at the rate of about 1 percent per year (SFYP, 2011). The country is losing nearly 82,000 hectares of land in each year and 220 hectares every day. Population growth rate of the country is about 1.48 % while the rate of urbanization is nearly 7 percent per annum (Tariquzzaman, 2009). The cultivable land in 1983-84 was 20 million hectares and in 1997 it dropped to 17 million hectares (MOL, 2014). If it continues, per capita arable land will be reduced to below 6 decimal in 2050 and all of our agricultural land would diminish within 100 years (Tariquzzaman, 2009). This terrible situation is very crucial for an agro-based economy like Bangladesh. If such uncontrolled intervention rate continues, it would be very difficult to save the agricultural land of the country.

1.3 Scope of the research

Integrated and ecology-oriented sustainable land zoning is indispensable for overpopulate Bangladesh (Ibrahim, 2004). Considering the limitation and potentiality, the best possible options for optimum and sustainable land use is the demand of time. The study analyzed some anthropogenic current activities on land specially the role of demographic features, occupation, industrial activities, commercial activities, settlement, urbanization, transportation and exploitation of natural resources. Likewise, the trend of decreasing nature and degradation of agriculture land due to unplanned and uncontrolled use explored from the research. Furthermore, the comparative analysis of land use pattern had discussed for a long period of time. Besides, the study analyzed the land zoning process that was undertaken by the government. Lastly, the study

discovered a new framework for compulsory efficient land use for sustainable development of Bangladesh.

1.4 Significance of the research

Nowadays, land resources are used for multi-purpose which has strong influences on the socio-economic development of Bangladesh. Human interventions on land resources are potential challenges for efficient and compatible use of land (Mia, 2004). On the one hand, unplanned interruptions are decreasing the proportion of land resources conservation and management. On the other hand, the demands of resources for population are increasing gradually. Thus, this study aims to explore different factors affecting scarce land over a period of time. More elaborately, it seeks to analyze current land use trends in the rural areas of Bangladesh and identifies significance and in-depth analysis of land zoning process for sustainable use of these scarce resources. It would come with notable policy guideline deriving from the findings of the study in time of policy formulation.

1.5 Objective of the study

The objectives of the research are

- To explore the features of changing rural land use and agricultural land transformation
- To determine factors causing improper land use and its socio, economic, demographic, and environmental impact on land topography and livelihood.
- To analyze the land zoning activities in consideration with field survey.
- To implement of compulsory efficient use of land (CEUL) system for ensuring sustainable land management.

1.6 Research question

1. What are the features of changing land use pattern in rural agricultural land?
2. What are the roots causes for inappropriate use of land?
3. How does improper land use decrease the trend of agricultural land and impact on other land?
4. Do the activities of land zoning process perform holistically?

5. How the compulsory efficient use of land (CEUL) system can ensure the sustainable management of land?

1.7 Methodological Aspects

On the basis of the nature of problem, the study would mostly apply qualitative approaches, methods and techniques. However, a limited secondary quantitative data would be referred. Since it is a combination of analytical and descriptive study, it is equally relied on secondary and primary sources of data. Mainly, journal articles, research reports of governments and international agencies have been consulted. On the other side, primary data sources are derived directly from field work. Moreover, a good number of approaches, techniques and methods have been utilised. A details description has been given separately in the Chapter -3.

1.8 Structure of the Research

In order to present the research findings systematically, the thesis has been arranged in the following structure. **Chapter 1: Introduction** started with a backdrop – basically a preamble of the study. Gradually arguments presented on significance the study. Basis of the arguments, research questions have been framed and discussed significance of the research question. A brief discussion has given on methodological context, scope and limitations. Finally, through this section, has been drawn the structure of the thesis. **Chapter 2: Literature Review** analysed theories and concepts land use planning and land zoning process. **Chapter 3: Research Methods and the Fieldwork** presented approaches of the research methods; fieldwork and application of research methods. Besides, it has briefly discussed limitation of the fieldwork. **Chapter 4: An Overview of Study area** has been discussed here in order to give a better understanding about the field location and nature of anthropometrics socio-economic dynamism. **Chapter 5: Legal Framework** discussed the different policies of the government that highlighted the consequence of land use and zoning for integrated planning of resource management of the country. **Chapter -6: Findings and Analysis** explored the dynamics of land use pattern over a period of half century of the study area and identified gaps between land zoning process and survey through logical analysis. **Chapter 7: Conceptual Framework** provided a new guideline (Compulsory Efficient Use of Land (CEUL) model) on multipurpose land zoning system through efficient use by utilizing systematic tools, techniques, information,

technology and finally governance. **Chapter 8: Recommendations and conclusion** provided suggestions and a brief review on the overall discussion. According the given structure of the thesis, the following chapter would discuss literature review.

Chapter 2: Review of Literature

Land is the basic natural resource that provides habitat and sustenance for living organisms, as well as being a major focus of economic and livelihood activities (Islam, 2005). It is intensively used for agriculture, settlements, forests, shrimp ghetters, water bodies and fisheries, salt production, industrial and infra-structural developments and tourism. The lands are important ecologically, as they provide a number of environmental goods and services to people (Islam, 2005).

2.1 Land policy towards community goals

Land policy is a means to achieve political ends (equity), economic ends (efficiency) and environmental ends (sustainability) (UNHABITAT, 2010). Land use planning refers to the way we plan the physical layout of communities and is an essential component of a community's long-term resilience (Niki, 2014). It encompasses both the built and natural environment by shaping where development occurs and identifying areas for preservation. The key components of land use planning include comprehensive planning and zoning regulation (Niki, 2014). The plans will generally include the community's goals and objectives along with its principles and policies. Land zoning prescribes where, what, and how development occurs on the land (Niki, 2014). Land use regulation serves a broad array of additional social and economic goals that include (1) protecting property values, (2) preserving the character of neighborhoods, (3) preventing environmental degradation, (4) enhancing the property tax base, and (5) encouraging tourism and other economic development (Sprankling, 2012).

2.2 Zoning for planned use of land

Zones are used as a way of grouping areas with similar characteristics together, integrating mutually beneficial uses, separating incompatible uses and setting outcomes for the area through policy (Commission's, 2011). Zoning entails designing various parcels of land for certain uses: commercial, residential, industrial, utilities, transport, recreation, bodies of water, flood plains and wildlife preserves (Chetty, 1998). This is an aspect of sustainable planning which is primarily concerned with certain guidelines, restrictions or limitations on the use of land (Chetty, 1998). Zoning is a means to an end that restricts the rights of private landowners in order to promote the health, safety, and welfare of the general public (Sprankling, 2012). The pioneers of zoning reasoned that the evils of rural and urban life can be overcome through

comprehensive land use regulation (Sprankling, 2012). Zoning divides the area into smaller units based on distribution of soil, land surface and climate (FAO, 1996). Zoning is an innovative idea for placing restrictions on the use of the land and natural resources by way of statute. Zoning is the use of governmental responsibility to regulate land use in a systematic way. Zoning laws divide a jurisdiction into separate geographic areas and impose limits on the permissible uses of land within each area (Massey, 2006). Zoning is characterized by the segregation of land uses into specified geographic areas and dimensional standards stipulating limitations on the magnitude of development activity that is allowed to take place on lots within each type of areas (Islam, 2005).

2.3 Objectives of zoning

The basic purpose of zoning is to control land use and to delineate on the land and water bodies what are considered to be their non compatible uses (Kling, 2006). This means establishment and mapping of land-use classifications or zones.

The specific objective of zoning is to specify which types of land use are considered appropriate for different ‘zones’, and it therefore indicates the planning control objectives of the authority for its administrative area. The authority is obliged under the planning acts to designate in its development plan objectives for the use solely and primarily of particular areas for particular purposes (DAP, 2005).

2.4 Legitimacy of Zoning

Legitimately zonings guarantee:

- (1) To prevent incompatible uses of land from unplanned use.
- (2) To increase property values generally by minimizing conflicts and
- (3) To channel development into patterns that may serve larger social goals (Massey, 2006).

2.5 Importance of Zoning

Competition for diverse uses of land resources, huge increase of population, devastation of natural and man-made hazards, economic opportunities and ecological hot spots call for distinctive zone management arrangements through the development of land use zoning (MOL, 2014). Zoning is essential because of facilitating the planned and systematic utilization of land

and ensuring the stipulated use of land to ensure maximum utilization of land and stop misuse of land (Barkat, 2007).

2.6 Key issues of Land Zoning

Urban and rural areas

- Agriculture, horticulture, fisheries, livestock, mineral resources
- Housing, settlement and homestead
- Forestry (agro, homestead & community), tree plantation, garden, conservation, wild life
- Waterbodies and water resources, flood control embankments, Fishermen
- Roads and highways, railways
- KPI, administrative unite, public and private institutions
- Industrialization, commercialization,
- Coastal areas, charland, hill (DAP, 2005).

2.7 Land use Classification

- Urban Residential Zone
- Commercial Zone (Business)
- Commercial Zone (Office)
- General Industrial Zone
- Heavy Industrial Zone
- Mixed Use Zone (Commercial-General Industrial)
- Mixed Use Zone (Residential-Commercial)
- Mixed Use Zone (Residential-Commercial-General Industrial)
- Mixed Use Zone (Residential-General Industrial)
- Institutional Zone
- Administrative Zone
- Agricultural Zone
- Flood Flow Zone
- Open Space
- Overlay Zone

- Rural Settlement Zone
- Water Retention Area
- Water Body (DAP, 2005).

2.8 Criteria for different land zoning

For the identification of different land zones, some basic criteria are required to analyze for showing their suitability for best uses in different fields (LZR, 2011). The suitability is the aptitude of a given type of land to support a defined use (IAO, 2014). Different zones are established as per their criteria, physio-chemical characteristics and agreed approaches and also people's perception on land use and proposed land zoning (LZR, 2011).

2.9 Land analysis for zoning

To assess land zoning, analyzing of (i) land type, (ii) land capability and (iii) crop suitability is very important.

2.9.1 Land Type

Land type is the dominant factor guiding choice of crops and cropping patterns in Bangladesh's characteristic agro-ecological situations (SRDI, 1989). Selection of cropping pattern largely depends on the topographic position of land in relation to rainy season inundation depth and its duration (SRDI, 1989). Bangladesh Soil Research and Development Institute (SRDI) identified different types of land like Highland (H) for Non Flooded, Medium Highland up to 90 cm from, Medium Low land 90-180 cm, Low land 180 –275 cm and Very Low land > 275 cm.

2.9.2 Land capability

Land capability is a qualitative methodology to classify land resources based on soil, topography and climate parameters without taking into account the yield and social economic conditions (IAO, 2014) Land capability class and sub-class is the package built on the interactions of soil properties and environmental factors with the output, providing an indication of different degrees of potentiality of land for the sustained production of common agricultural crops in a year (SRDI, 1989). According to the capability lands are classified into: (i) very good agricultural land, (ii) good agricultural land, (iii) moderate agricultural land, (iv) poor agricultural land and (v) very poor or non-agricultural land.

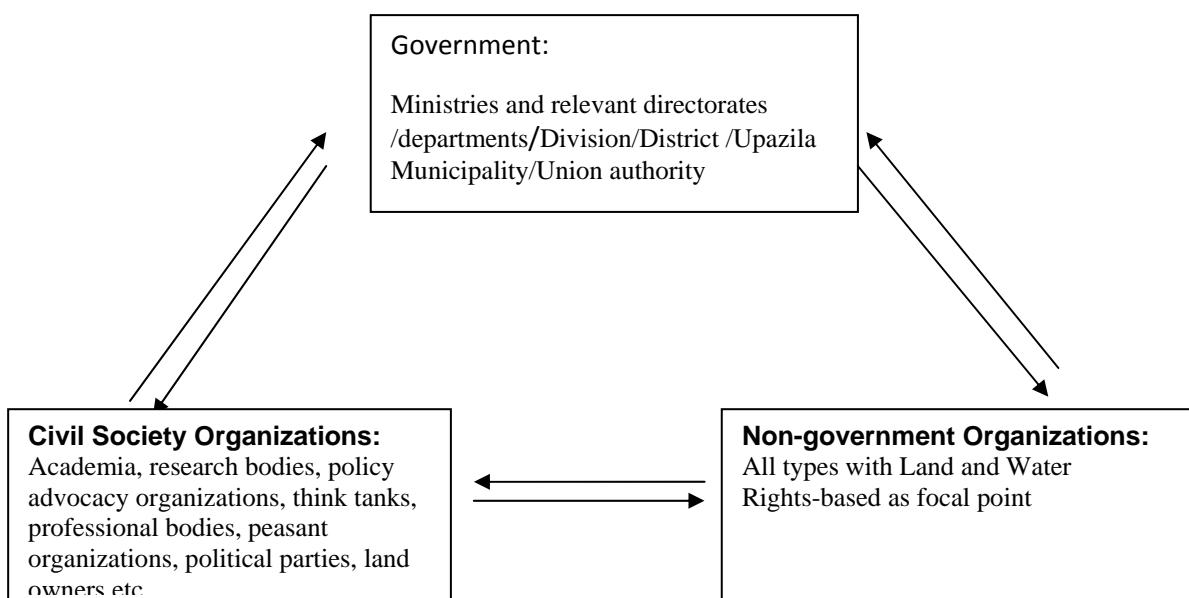

2.9.3 Land suitability

The suitability of a given piece of land is its natural ability to support a specific purpose (IAO, 2014). Crop suitability classes this technology, unlike land capability classes provides a basis for determining the degree of prospects and limitations of the soil within an area for growing a specific crop species or variety in a specific season (SRDI, 1989). Key factors related to crop production, such as depth and duration of rainy season, inundation of land, length of period for which the soil can supply optimum quantity of plant available moisture during the dry season, natural fertility status of soil were given special consideration besides climatic and other factors, in the crop suitability assessment. In fact, the crop suitability package is the resultant of the interactions of as many as eleven important soil factors together with the moisture and thermal regimes of the climatic factor (SRDI, 1989). According to the FAO methodology (1976), land suitability is strongly related to the "land qualities" such as erosion resistance, water availability, and flood hazard that are not measurable. Five suitability classes of land are recognized, depending upon the yield of the crop grown and they are as follows: (i) very suitable, (ii) suitable, (iii) moderately suitable, (iv) marginally suitable and (v) not suitable.

2.10 Stakeholder's involvement in zoning process

The whole exercise of land zoning – due to its long-term sustainable development implications and complexity – should involve active participation of all relevant stakeholders (Barkat, 2007) as shown in the figure below:

Figure-2.2: Stakeholders to be involved in land zoning

Zoning is practiced as the principal method for controlling the development of land. It is a system where land is designated for a principal use and uses that are considered not to be suitable or compatible with the principal use are prohibited. There is also the ability to require certain uses to submit an application for use of the land, which is then assessed having regard to a set of published assessment criteria (Sinclair, 2002)

2.11 Multidimensional aspect of zoning

Zoning belongs to several dimensional aspects. **Traditional zoning** divides a municipality into various zones and designates at least one as-of-right use – such as residential. More recent approaches to zoning employ mixed uses within a zone, which allows for a more diverse landscape within a geographic area (Niki, 2014). Cumulative zoning, mutually exclusive zoning, density zoning and cluster zoning may have different character whether **cumulative zoning** identifies land use in a spectrum from higher to lower, mutually exclusive zoning permits some uses and excludes all others within the zoned, **mutually exclusive** zoning is most often used with respect to industrial or heavy commercial areas, density zoning control the density of occupation within any given use area and cluster zoning is to zone a particular area for a particular use at a specified level of density of occupation (Massey, 2006). Based on planning and proper maintenance of resources of an area zoning can classify into three perspectives (Hagerty, 1995) that are **Euclidean zoning** that is used extensively in small towns and large cities alike. Euclidean zone characterized by the segregation of land uses into specified geographic districts and dimensional standards stipulating limitations on the magnitude of development activity. Typical types of land-use districts in Euclidean zoning are: residential (single-family), residential (multi-family), commercial, and industrial (Hagerty, 1995). **Performance Zoning** is a goal-oriented criterion to establish review parameters for proposed development projects in any area of a area. Often uses a points-based system whereby a property developer can apply credits toward meeting established zoning goals through selecting from a menu of compliance options (some examples include: mitigation of environmental impacts, providing public amenities, building affordable housing units, etc.) (Hagerty, 1995). **Incentive Zoning** intends to provide a reward-based system to encourage development that meets established urban development goals. Typically, a base level of prescriptive limitations on development will be established and an extensive list of incentive criteria will be established for developers to adopt or not at their discretion. A reward scale connected to the incentive criteria provides an enticement for

developers to incorporate the desired development criteria into their projects (Hagerty, 1995). Zoning can be considered from three broad perspectives (Mutsaers, 2004) that are **descriptive zoning** that is presenting the factual information in a geographic form by mapping the actual situation in respect of some feature or combination of features, like the occurrence of current land uses, population densities etc. **Analytical or predictive zoning** defines land classes by combinations of physical parameters, expecting that they will predict or explain an important phenomenon like crop yield or land suitability (Mutsaers, 2004).

2.12 Zoning and governance

Zoning is a form of legal power which is delegated to development authorities through enabling legislation to ensure the welfare of the community by regulating the most appropriate use of the land (DAP, 2005). Zoning is a method of regulation carried out by local governments to control the types of physical structures that can be built in various jurisdictions of a county, as well as what type of use land may be put toward within those certain jurisdictions by classification (Fischel, 1999). Zoning divides a jurisdiction into geographically contiguous ‘zones’ and allows municipalities to shape their residential environments (Fischel, 1999). Zoning is a collective property right that is used by the local authority to maximize the net worth of those in control of the political apparatus (Nelson, 1977). Zoning implies the authority to classify land and waterbodies according to its suitability, and to enforce the classification of permitted uses. Zoning in cities has dealt largely with the suitability of some lands for development, thus restricting industrial, commercial, or other development to those lands, and prohibiting it elsewhere. Rural zoning seeks to prevent farm settlement where such settlement would create unwarranted burdens for schools, roads, and local administration and would, moreover, interfere with the best use of the region as a whole, such as for forestry and recreation (Barkat, 2007). Urban economists have sometimes attempted to model zoning as a single-valued constraint, such as minimum lot size. Such exercises can often be useful in working out implications of land-use constraints in an urban economics model (Rubinfeld, 1978).

2.13 Zoning controlled abuse of land

Zoning ensures the control of abuses of uncontrolled private development, launch the faith in scientific planning and administrative control and make the division of geographical areas into segment with regulation within each portion. It is most often used for properly maintenance of bio-diversity in the area, research and for planning purposes (Islam, 2005). The division of land

into homogeneous areas and their ranking according to degrees of actual or potential landslide susceptibility hazard or risk (AGS, 2007).

2.14 Zoning as development tools

The zoning will first and for all be a tool for government in stimulating, facilitating and regulating social, economic and environmental development, taking into account the interests of different groups of stakeholders and socio-economic and environmental potentials and vulnerabilities (Islam, 2005). It should allow to make informed choices for investment in human and physical resources and impose protective regulations where needed (Islam, 2005). Zoning, as a tool for area development is an ambitious goal, which can only be attained through different development stages (Islam, 2005). Zoning is not simply a rhetorical expression of a community's desires; it describes the public policies that a local government actually intends to carry out (Mandelker, 1976). The zoning plan is to be grounded in separate technical reports that documented its rationale with quantitative and qualitative analyses of community growth and current and future land use relationships, preferably taking into account the impact of proposals for future public improvements (Mandelker, 1976). Government zoning is thought of as either an important tool that local government use to control the pattern of land use or as an irrelevant exercise that merely conforms to market outcomes rather than modifying them. It is possible that government zoning might have radically different allocative effects in different communities (Asabere, 1979).

2.15 Zoning as comprehensive plan

Zoning must be consistent with an independently adopted and basis of local comprehensive plan that occupies state legislators, judges, professional planners, and attorneys (Mandelker, 1976). The comprehensive plan should include issues and opportunities, housing, transportation, utilities and community facilities agricultural, natural, and cultural resources, economic development; intergovernmental cooperation, land use, and implementation (OSPG, 1995). The framers of the zoning plan must make numerous assumptions regarding the future of the area in respect to all of these matters without the benefit of detailed information and study (Mandelker, 1976). Two fundamental considerations would need evaluation in the formulation of the zoning plan; (1) how much area is needed for each broad type of use and how shall it be

arranged or balanced in any given community? (2) What regulations are needed in the several use districts to afford good relations between individual structures? (Bassett, 1922).

2.16 Zoning and externalities

Zoning may not only increase efficiency by separating incompatible land uses and reducing the flow of negative externalities, it creates inefficiency by distorting the supply of land to the various uses (Colwell, 2011). Zoning priority depends on distance, location, land value, business of areas, economic activities. For inclusion, zoning can be explained from hierarchical and government perspective. Cumulative zoning or progressively inclusive zoning operates by allocating a zone to a particular land use or any higher use in the governmentally defined hierarchy (Colwell, 2011). The rationale for hierarchical zoning suggests that it restricts the flow of negative externalities from lower to higher land uses in the hierarchy. If this is the only effect of governmental zoning, the value of the highest uses in the hierarchy would be raised as a result of the protection provided by the zoning ordinance (i.e., *ceteris paribus*). That is, those who desire to use land for residential purposes, usually the highest use in the hierarchy, are able to choose from land in any zone, but would be willing to pay more for land in the protected residential zone, holding location and other factors constant (Colwell, 2011). On the other hand, governmental zoning may be put to other purposes. Special interests in and out of government may be able to shape governmental zoning to serve their own ends (Colwell, 2011). Governmental zoning has its impact on urban land values primarily through supply rather than externality effects. Local government may engage in fiscal zoning in order to directly protect its purse and indirectly beggar neighboring governments (Fischel, 2000). Communities use zoning rules for including to prevent externalities that might arise from overcrowding or congestion; to affect the distribution of the cost of public services; to exclude certain groups or types of housing ; and to prevent development and preserve undeveloped land uses such as farming, typically by setting restrictions (Fischel, 2000). Zoning has also negative effect (Gardner, 2001). If minimum zoning requirements are set too high, they can stifle the organic, iterative process that causes development to gradually intensify and land values to raise high enough to support gradual densification. Therefore, it can also have unintended side-effects if not thought through carefully (Gardner, 2001).

2.17 Zoning address market failure

The economics behind zoning is to address and control market failures such as spillover effects of unwanted uses, natural monopolies, equity and distribution and growth management in the various jurisdictions of a city (O'Sullivan, 1995). Exposed that zoning manage growth and control negative externalities.

Thus zoning produces a top-down approach to development, often characterized by monolithic uses, but the absence of zoning can produce a crazy quilt of shifting uses, responding to discrete economic events that may lack any pattern (Massey, 2006).

Chapter-3: The Research Methods and Fieldwork

3.1 Introduction

Suitable methods, techniques, and tools are important to achieve objectives of any research. These provide a basic framework for collecting, analysing and presenting of any study findings and data. Based on the nature of the study, the research applied a number of methods, tools and analytical approaches for a deeper understanding of the stakeholders' attitudes, action, knowledge, perceptions and response towards the problems, issues and dimensions of land use system and zoning process of Bangladesh. The study is mainly based upon qualitative methods like direct observation, plot to plot survey, focus group discussion, key informant interview, life history and open ended discussions. Further, the study is the combination of primary and secondary data. This chapter briefly discussed reasons for selecting the field, the approaches, methods, tools and techniques of data collection what have been applied in the study.

3.2 Selection of the Field

For three purposes, the research area has selected as Asuganj Upazila in Brahmanbaria district. Firstly, in terms of land use pattern, the area was radically changed over five decades. Secondly, land zoning activities completed in this Upazila. So it would favor researcher to work in a congenial atmosphere. Thirdly, it is essential to understand mass people's perception on land zoning that can be traced out through the research.

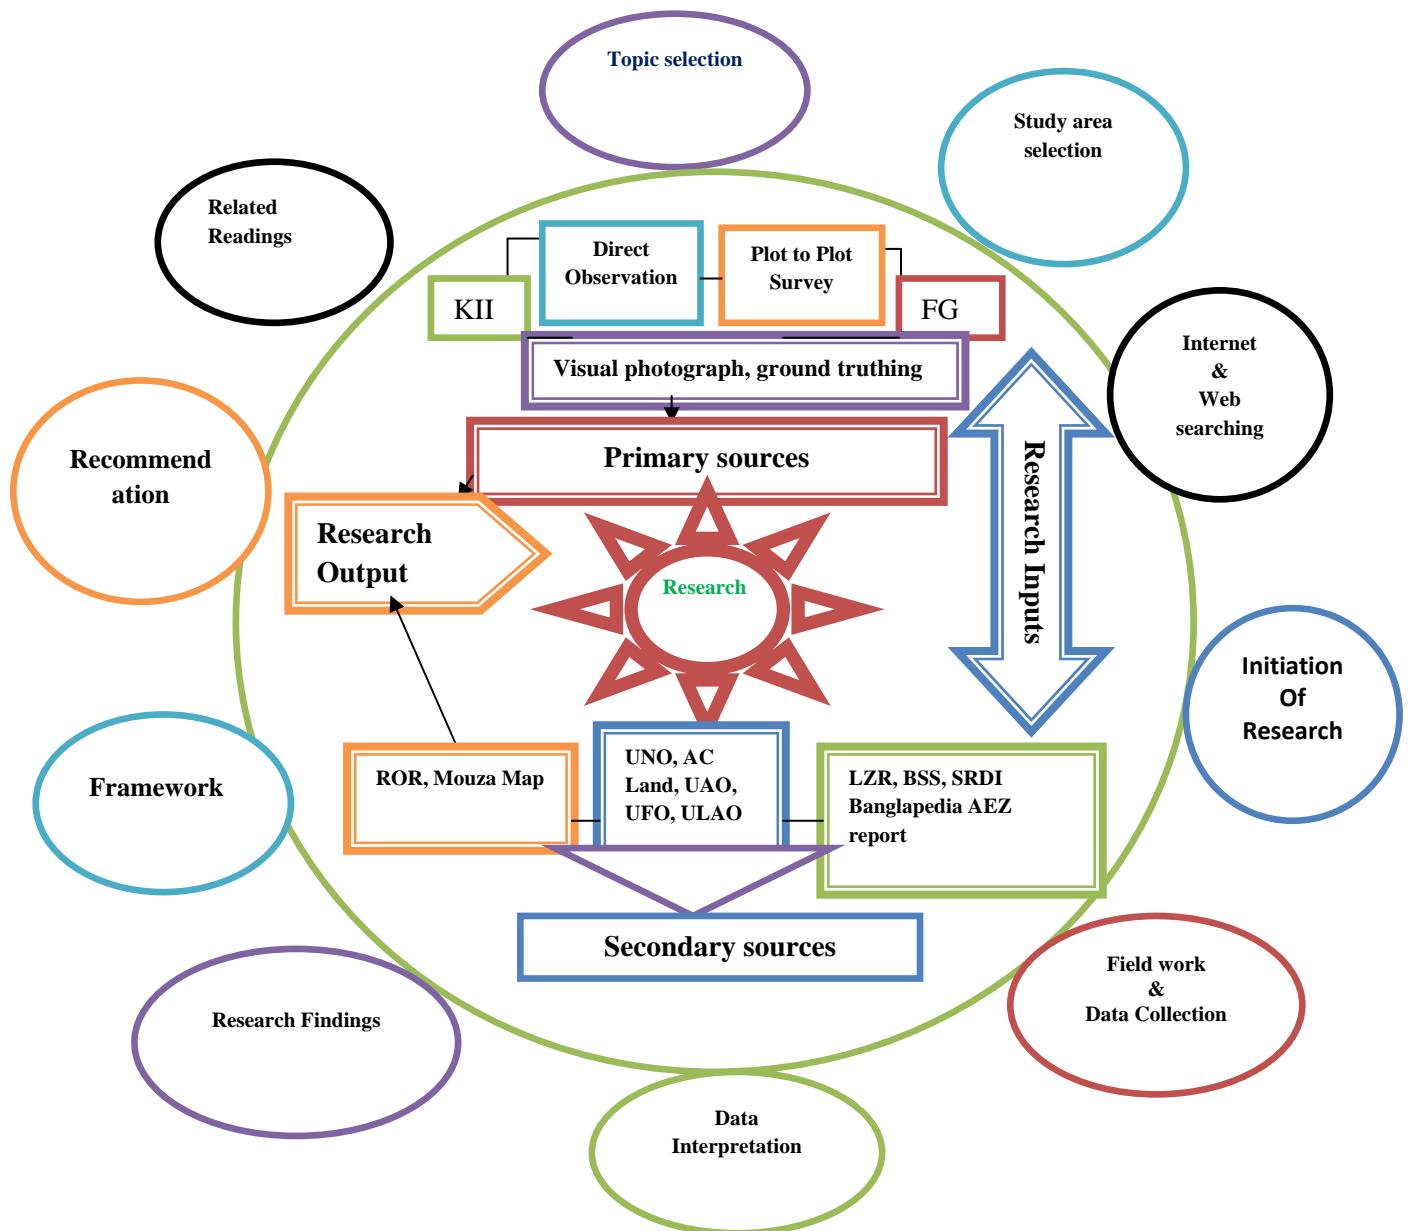

3.3 Research Methods

3.3.1 Detailed Observation and Rapport Building

Here, the researcher attempted to build up rapport with the study areas through gossiping, exchanging greetings, general discussions etc. At the same time wide observation has made to gain an overall idea about the physiography of the area. For understanding reality from the ground, direct observation touched every spare to explore the data and biography of the study area. Direct observation contributed to the development of the case study and provided an opportunity for researchers to observe directly what is happening in present land setting, interact with local stakeholders, and site visits. It provided insight into the taken-for-granted aspects of every aspects that may go unreported by local stakeholders-land owners-zoning personals, gives

the researcher direct experience of the phenomena being studied, and created an opportunity to see and hear what is happening in the real setting rather than focusing solely on narrative descriptions of local people. The study area is covered one union one mouza. The direct observation filled up the gap between theoretical conception, published record like zoning map, ZIS map, and mouza map and present study. First hand data been gathered from the observation built the overall idea for structuring and designing the research.

Figure-1: Research Design

Source: Developed by Author, 2014

3.3.2 Key informant's interview (KII)

A few of in-depth or detailed interviews have conducted with the key informant which helps to design of applying other methods. Usually, they have been selected various processes like knowledge on the subject matter, experiences and availability. Personnel's of land administration, officials of land zoning project and local stakeholder have interviewed for collecting multifarious-in-depth knowledge and unveil information on land use planning and zoning (appendix-7). Intentionally, the interviews have designed in semi structured manner because it gives more opportunity of listening from the interviewees. Reflective, interpretative and decisional questions related to land use planning and zoning were discussed with key informants.

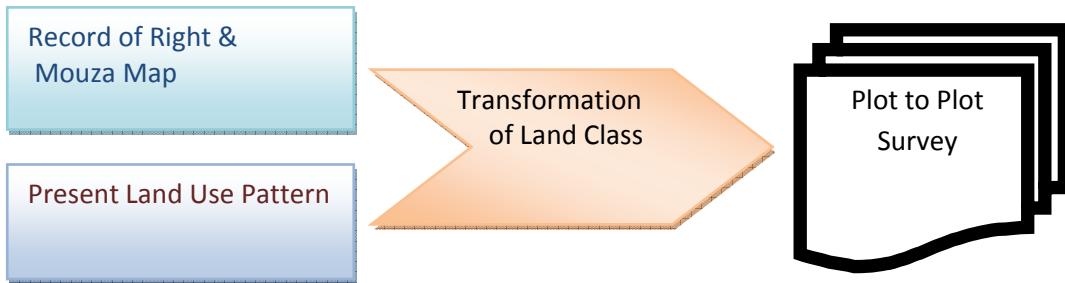

3.3.3 Focus group discussion (FGD)

During the fieldwork, focus group discussion (FGD) was conducted to collect as well as validate data. The participants were selected through multistage cluster sampling. .Focus group discussion (FGD) was conducted with local stakeholders of the study area with a group of 18 people for a two hour long. Moreover, Researcher listened to land zoning and land use pattern from the local people how cultivated land has become a threat for their unplanned intervention. Various issues acknowledged from their perceptions, opinions, beliefs, and attitudes towards land use, zoning and socio-economic aspects of the study area (appendix-6). Some important concepts related with land use and zoning were supplied in an interactive group setting where participants were free to talk with their group members.

3.3.4 Plot to plot survey

Plot to plot survey was the basis of Bangladesh survey (BS). By using mouza maps and record of right (ROR), the plot to plot survey compared the present land use pattern. The research went throughout the existing land plot and traced out their present use. After that the study compared with the BS mouza map and ROR and figured out the transformed nature of land plot over time.

Figure: The structure of Plot to Plot Survey

Source: Developed by Author, 2014

Plot to plot field survey carried out for measuring individual land plot structure, size, types, use, changing pattern, degradation and development by which researcher gathered ethno-physiographic features of land pattern of the study area. Plot to plot survey also shaped the information of present and past land use pattern and dynamics of the study area.

3.3.5 Consultation and review of previous documents

A number of relevant literatures, working paper and policies were reviewed for the study. Some policy documents were consulted such as the state acquisition and tenancy act (SA&T Act) 1950, national land use policy (NLUP) 2001, sixth five year plan (2011-2015), perspective plan of Bangladesh (2010-2021), coastal land zoning policy 2005, **the territorial water and maritime zones act 1974**, the national water policy 1999, national agriculture policy (NAP) 1999, national fisheries policy 1998, shrimp strategy 2004, national forest policy 1994, the national sustainable development strategy, national food policy (NFP). These have helped make a comprehensive literature review of land related works done in the past in Bangladesh. Secondary data was collected from Land Zoning Project Office, Brahmanbaria settlement office, Upazila Nirbahi Office, Fisheries Office, Agriculture Office, Upazila land office, union land office, union council, soil research development institute (SRDI) and some other different sources.

3.4 Limitation of the research

Regarding land zoning and changing pattern of land use over time, no qualitative case study has undertaken to explore the real scenario of Bangladesh. As a result, author couldn't get any support from other study to carry out the research smoothly. To conduct such a qualitative case study, the time limit was insufficient and it was not easy to conduct field work for exploring the holistic view of the research area. The secondary data and information, that made the author enriched of knowledge and influenced to search new thing for idea generation, was not sufficient in Upazila level and for that researcher had to go to other different institutions and organizations beyond of Upazila. To carry out the research, record of right (ROR) was important but due to civil case filed against land management department of Brahmanbaria the RS record was not supplied to the Upazila and district land management department. As a result, the author had to go to settlement department to collect said document. On the other hand SA record was not clear to support the study. Most of the record of SA operation was destroyed and dusted for mismanagement of office record room. Likewise, all CS, SA and BS mouza was not preserved for official work in the land administration and management department and for that the researcher had to collect a number of mouza maps from settlement office and director general of land record office. Furthermore, the information for the research was not available in the Upazila and district and for that the researcher used to collect from other sources like SRDI, BSS, MOL etc. Likely, the manual data input process took a long time that hampers the researcher to design the report within the designated time. The research was so technical and for that researcher had to learn much technical knowledge to face challenges. The resource crisis was not made resistance to execute research while the enthusiastic and courageous attitude for new exploration influenced the author to carry on the research.

3.5 Conclusion

Since the process of land management and settlement and pattern of land class transformation in the context of the study area is very complicated, the study has employed a good number of approaches, research methods, tools and techniques to capture the scenario from the holistic perspective. In order to give a better understanding of the study, the research provided the phases of fieldwork and data collection procedure. Let us have a look the study locale and institutions in the following chapter.

Chapter 4: An overview of study area

4.1 Introduction

Char Chartala Union is located in between $23^{\circ}51'$ and $24^{\circ}06'$ north latitudes and $90^{\circ}53'$ and $91^{\circ}19'$ east longitudes (Banglapedia, 2014). The total area of the union is 3586.42 acre (appendix-2) (Survey, 1995). The union has 09 wards. It also consists of a large village which is covered with one big mouza. It is said that the area alleviated (Bengali char) from the river Meghna with four parts and shaped a large land plate and for this the area named as Charchartala (UP, 2014). It is bounded by Bhairab Upazila of Kishoreganj district on the north, Nabinagar Upazila on the south, Lalpur, Arshadia and Asuganj union of Asuganj Upazila on the east and Vhairab Upazila of Kishoreganj district and Raipura Upazila of Narshingdi district on the west. Besides, the Meghna River flows on the south, north and west site in between other bounded Upazila and only east site belongs land boundary. For the tri-portion boundaries of river, the union can be called the daughter of the river Meghna. It is a notable river port and industrial area of Brahmanbaria District.

4.2 Climate

The climate of the area is dominated by the influence of the Himalayan mountain ranges and the monsoonal systems in the Bay of Bengal (AFSCL, 2011). The climate is sub-tropical with summer, monsoon and winter seasons. Rainfall is monsoonal, inter-monsoonal or cyclonic in origin. The maximum annual rainfall in the area as recorded was 4127mm in the year 1952 and minimum yearly rainfall is 1439mm in year 1989 with peak rainfalls occurring in July and August (AFSCL, 2011). Furthermore, from mid November to February is the coolest and driest period; April to May is the hottest period with periodic heavy thunderstorms: June to mid September is the most rainy and humid period and mid September to early November is a transitional period with decreasing rainfall, often with association of thunder but with relatively high temperature and humidity (AFSCL, 2011).

Map 3.1: Map of Charchartala union

4.3 Land type

The soil of charchartala typically is non-calcareous dark grey floodplain soils (FAO-UNDP, 1988). The geology of the study area consists of Quaternary Deltaic sediments, which have been strongly influenced by tectonic movements on deep-seated faults. The area lies on a tectonic block, which has been uplifted relative to the surrounding areas. The soil profile of the study area consists of about 12m thick clay deposit followed by sand, clay and progressively coarser sand as depth increases (AFSCL, 2011). The Char Chartala union comprises four types of land which are High Land (HL), Medium High Land (MHL), Medium Low Land (MLL) and Low Land (LL) (LZR, 2011). Medium Low Land is the dominant factor which covered 60% of areas whereas Low Land enclosed 30% of areas and rest of two types of land covered average 5% of areas (LZR, 2011). Most of the areas of low land and medium low land are to be covered with open water during rainy season. The flood plain areas are covered by fertile loam and clay with seasonal moving water of the river Meghna. The low lands to medium low land having fertile soil are used for agriculture during dry season. During rainy season the area is fully inundated. The following areas are covered with flood water during rainy season. Seasonal inundation does not permit to grow crops and no crops produce in this period.

4.4 Land capability

The land of Charchartala is suitable and potential for crops productions. Triple to single pattern of crops are produced in a year on these land due to presence of top soil quality and yearly siltation flowing by the River Meghna. Besides, internal and external soil properties like temperature, moisture, aeration, fertility, depth, texture, toxicity, tilth, topography, depth of flooding, accessibility and trafficability are in favor of agriculture production. At the same time, the soil is more related to agriculture potentials. In other words, due to environmental degradation, unplanned housing settlement, urban sprawl, industrial expansion reduce the potentiality of agriculture production which is resulting moderately suitable that means limitations of utilization of crop land for sustained application for growth of agriculture product. Furthermore, seasonal inundation, flood, draughts, drainage, land disturbance, erosion, and human intervention reduce the quantity of agriculture products of this area.

Table 1.3: Some basic criteria for different land zones

Criteria	Agriculture	Forest	Fisheries	Urban/Industry	Roads/Highways	Tourism
Land Type	HL to LL	HL	MHL to VLL	HL (less fertile soil)	HL to MHL	HL with well communication
Drainage	Pd to Impd	Mwd to Wd	Pd	WD to Mwd	Wd	Wd
Surface Water Recession	Early to late	Early	Late	Early to very late	Early to normal	Early to very early
Texture	Silt loam to Clay	SL to Clay	SL to Clay	SL to Silt Clay	SL to Silt Clay	SL to Silt Clay
Relief	Level (plain)	NA	NA	Level (plain)	Level (plain)	Level of undulating (raising and falling)
Salinity	0-4	Very low	<2	n/a	n/a	n/a
pH	5.5-8.5	3.0-7.5	-	-	-	-
Buffering limit	-	-	-	-	1 km both side	-

Source: Land Zoning Report: Asuganj Upazila, 2011

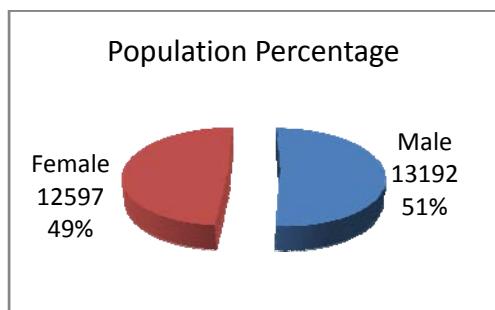

4.5 Land suitability

The study area belongs to a semi arid region characterized by temporal drought. The irrigation to be adopted during the dry season and rainfall and flood occurs during rainy season. Land is moderately suitable on account of having minor limitations to the given type of use. The land is decreasing her erosion resistance capacity by dint of continuously degradation from industrial chemicals. The flowing natural water of the Meghna River is contaminating by the waste and chemical of industries.

4.6 Population

According to Bangladesh Population & Housing Census 2011, total 25,789 people live in the Charchartala union of which male 13,192 and female 12,597.

Table 1.2: Population of charchartala union

Year	Total population	Male	Female	% of Yearly Increasing Rate
2001	23555	12500	11055	0.95%
2011	25789	13192	12597	

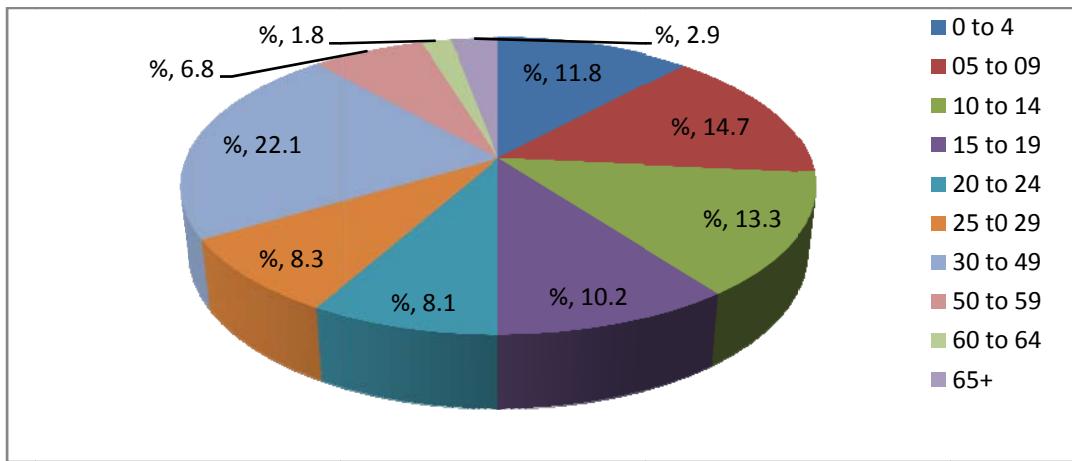

Source: Bangladesh Population & Housing Census 2011

In 2001, total population was 23,555 of which male female ratio was 106.13:93.87. Over a period of ten (10) years, male ratio decreased 4% whether female ratio increased approximate 4% and the sex ratio changed from 106.13:93.87 to 102.30:97.70. During this period the number population was increased from 23,555 to 25789. Total 2234 population added and the yearly percentage of increasing trend is 0.95% which indicates that the present population will double in number 105 year later.

4.7 Population in the age group

The positive site is that the percentage of population in the age group expresses the potentiality of working generation. On the one hand, the trend of new born infant is controlled in size which is only 11.8% of total population and 38% of potential rising children and teenager that is a positive site of the union.

Figure 2.3: Percentage of population in the age group

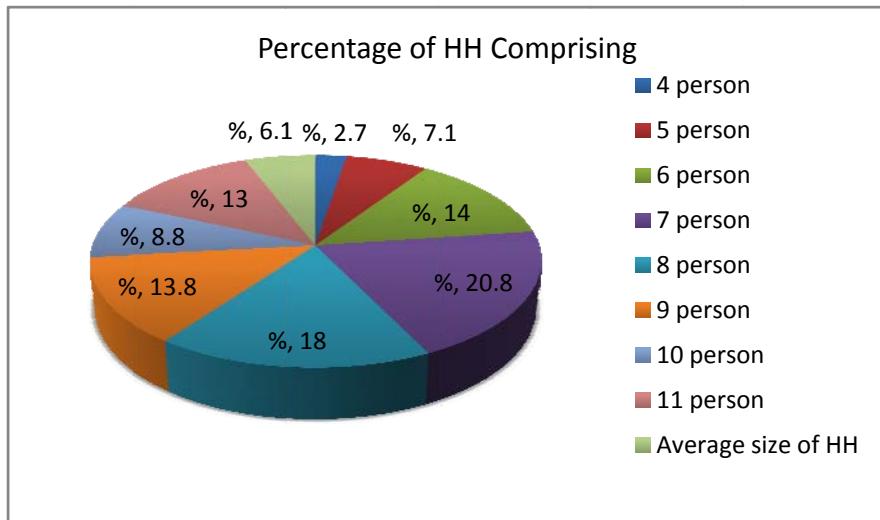

Source: Bangladesh Population & Housing Census 2011

Likewise, 38.5% of potential population is engaged in several working activities in the internal and external arenas. Furthermore, only 1.8% people are going to be age old.

4.8 Population in the household comprising

In household pattern, the numbers of members are different in size. The household size consists of four to eleven whether the average number for each HH is 6.1% of total household.

Figure 2.4: Percentage of HH

Source: Bangladesh Population & Housing Census 2011

The chart indicates that 2.7%, 7.1% and 6.1% household consist of 4, 5, and 6 member whether 20.8%, 18% and 13.85 household consist of 7, 8 and 9 member. Besides these, 8.8% and 13% household belong more than 10 members.

4.9 Family structure

The Charchitala is dominating by patrilineal ties family. Different types of family like joint family, extended family, nuclear family are found in the area. Married sons generally live in their parents' household during the father's lifetime. Although sons usually build separate houses for their nuclear families, they remain under their fathers' authority, and wives under their mothers-in-law's authority. The death of the father usually precipitates the separation of adult brothers into their own households. Such a split generally causes little change in the physical layout of the household.

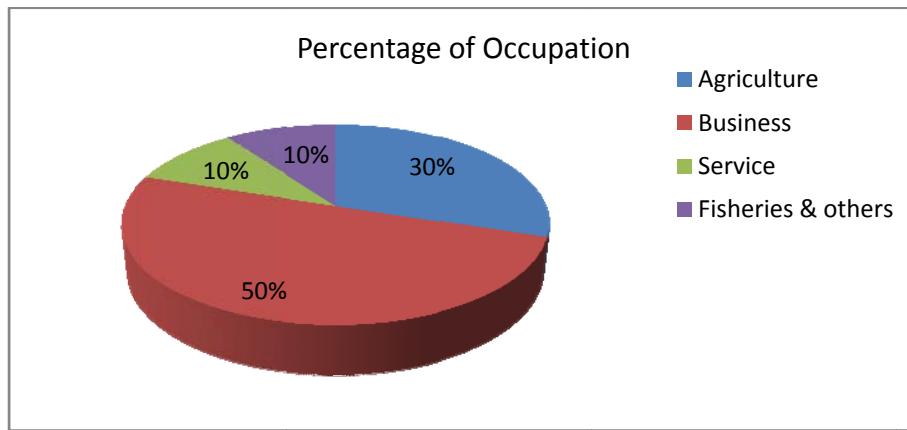

4.10 Education

The union has one college, two high schools, two primary school, four madrasa, and seven kinder gardens. The literacy rate of the area is 56.35% of which male-56.7%, female-53.1% (BBS, 2011).

4.11 Occupation

In Char Chartala, farming is decreasing as occupation. At present farming as occupation are 30% of total households respectively. Northern portion and industrial belt of Charchartala union belongs urban character and remaining area is predominantly rural. Agriculture activities and business are the main occupation of the area.

Figure 2.5: Percentage of occupation

Sources: BBS, 2011

Previously, agriculture was more dominant but now its position is diminishing. Agriculture, service and fisheries and others occupations coverage are 30%, 10%, 10% and 30% respectively while 50% occupation dominated in business.

4.12 Cropping pattern

Main crops grown in the study area are aus and boro paddy. Besides this, potato, sweet potatoes, oil seeds, groundnut, vegetables, arum, til (sesame), wheat, sugarcane, mustard, lentil, onion etc. are cultivated in the study area. Watermelons are produced in the study area (UAO, 2014). Fruits like, jackfruit, lemon, watermelon also to be produced.

Picture of Sweet Potato in Char Chartala

4.13 Fishing

The union is enriched with open water fishes which are available in the river, canal and floodplain. The river Meghna is flowing three sides of the union. During monsoon fishermen catch fishes in the upper Meghna River. There are two Jalmahal (open water fishing zone) over 20 acres of water bodies. Number of pond is 8 and most of them are under fish culture. Major fish varieties are ruhi, katla, taki, kai, magur, singhi and boal etc. Fish is an important resource of the area. Dependent population on fishery is 2% in the upazila.

Char Chartala Jalmahal (open water fishing zone)

4.14 Religion

The area is predominantly Muslim. In Asuganj, 95.84% population is Muslim and rest is mainly Hindu communities. The Study area's condition is also same. In the sample area mainly Muslims are residing. Hindu communities are very minor.

4.15 Housing pattern and ownership

In the project area, maximum people live in their own houses but a few in rented houses. As more urbanization, more households reside in the rented house in the area. The area is a semi urban in nature. Moreover, it has also a rural character. Most people live in inherited land.

New housing pattern in village area

4.16 Cultural aspects

People residing in the Charchartala union, mainly Muslims and Hindus. The general culture and heritage of the area based on core belief of both the religions. The Muslims pray in the mosques and observe their religious festivals like Eid; the Hindus observe their pujas (Durga puja, Kali puja, etc.) in the temples. They usually celebrate various religious occasions as well as pujas as a religious festival of the Hindus.

4.17 Road communication

The Dhaka – Sylhet highway and rail line passes through the middle of the study area. There are other metaled roads of LGED in and around the study area. Besides the train communication facility mechanized vehicles like truck, bus, car, jeep, baby taxi, battery driven auto rickshaw, CNG auto rickshaw, tempo, motor cycle etc. ply in the road. Non-mechanized traffic like rickshaw, van, bicycle, cart etc. utilize these roads. These transports are regularly carrying both passengers and goods.

Dhaka-Sylhet Highway to Fertilizer Industries Connecting Road in Char Chartala

4.18 Working place of population in the study area

In the union, most of the low income people work in market, drive rickshaw and pay for day labor. In urban area, various types of non-agricultural activities are involved. A large number of labors work in boiler based rice husking mills. Labors of husking mills come from adjacent low-lying haor areas. Educated go to the capital city.

Picture: Boiler Based Rice Husking Mill

4.19 NGO activities

Different NGOs are working in the area. Name of the major NGOs are ASA, BRAC, Grameen Bank, Proshika Manabik Unnayan Kendra, etc. The main activities are microfinance, group formation, savings and community and Health services.

4.20 Sayed Nazrul Islam bridge/Bhairab bridge

Sayed Nazrul Islam Bridge is a multi-span prestressed concrete box girder structure 920m long, which carries the Dhaka - Sylhet trunk road and provides a direct connection between the riverside towns of Asuganj and Bhairab. It is located over the river Meghna. The bridge was completed in 2002. This bridge

Picture: Vhairab Bridge

improves communications between Dhaka and the Sylhet region in the north east of Bangladesh & cut journey times to Sylhet. The main bridge is 1.2 km long and comprises seven 110m spans and two 79.5m spans.

4.21 Abdul Halim Rail Bridge/Bhairab Rail Bridge

Abdul Halim Rail Bridge over the [Meghna River](#), popularly known as the Bhairab railway bridge, was opened on 6 December 1937, enabling passage between Dhaka and Chittagong. Meghna Railway Bridge in Bhairab Bazar is one of the oldest massive still structures in Bangladesh. This is the

Picture: Abdul Halim Rail Bridge

only single line Railway Bridge which is connecting Dhaka division to Chittagong division. The bridge was developed by British Authority during British period in India to move their goods,

soldiers and business purpose. South side of this bridge was destroyed in 1971 War against Pakistan and repaired again after the war.

4.22 Asuganj fertilizer industry

Asuganj Fertilizer Industry was mechanically completed in October 1981 and placed in commercial production on July 1, 1983. The main objective of the Industry is to produce urea fertilizer using indigenous natural gas, thereby reducing fertilizer imports and saving scarce foreign exchange. As a major agricultural input, the increased domestic fertilizer availability would assist in increasing food production and furthering the objective of achieving food self-sufficiency. To a limited extent, the industry

Picture: Asuganj Fertilizer Industry

has also generated some employment and upgraded professional skills (WB, 1986). The industry includes natural gas based ammonia plant. The industry is based on the use of natural gas from the Titas and Habiganj gas fields as the feedstock and energy source. From the total area about half is used for the production facilities and the rest for the housing colony.

4.23 Gas Compressor Station of GTCL

The Gas Transmission Company Ltd (GTCL) is the state owned company of Bangladesh. GTCL constructed its compressor station at Char Chartala in Asuganj. Due to low pressure of gas ‘which disrupts its supply from the gas fields of the country’s eastern zone to Dhaka’ GTCL constructed it in the study area for improving gas supply and removing the crisis of low gas pressure in Dhaka (Independent, 2014).

Gas extracted from distant gas fields in the eastern region of the country is supplied through two pipelines to Asuganj Manifold Station of GTCL, and then to Brahmanbaria, Dhaka, Chittagong

GTCL Compressor Station, Char Chartala, Asuganj

and Rajshahi regions through four pipelines through the gridlines coming from Titas and Habiganj gas fields in Brahmanbaria.

4.24 Food Storage Silo Godawn

Asuganj Silo, one of the biggest silos of Ministry of Food, is situated at the point where the main line of the Eastern railway between Dhaka and Chittagong crosses the bridge over the Meghna River. Capacity of the silo is 50,000 MT. The main silo consists of 48 circular bins, and the hade house, which main food grain handling machinery. Basically the

Asuganj Silo

internal operation of the silo at Asuganj is to receive the food grain, clean and fumigate it if necessary, keep it in storage and transfer same from one bin to another, then ship out in bag or in bulk by means of rail wagon, trucks, boats and barges. Construction of this silo was started during 1967 and completed in 1971. The consultant of this project was Weitz-Hettlesater Engineers. U.S.A. Mechanical and Electrical Equipments supplied by Miag Buhler, a joint venture of Germany and Switzerland. Electrical Equipments supplied by Lau Knudsen Denmark and Civil Construction completed by Skanska Cemen geteriate, Sweden.

4.25 Rail Station

Asuganj rail station is one of the oldest stations in the country. The station makes the bridge

Asuganj Rail Station

Rail Bridge

Underpass

between Brahmanbaria and Kishoreganj district. The architecture of the station is so amusing to look and the shape of the station made it a unique position from the southern part of the station. Underpass of the station makes it more attractive and Rail Bridge on the west compose it more important. The place was more crowds before construction of Sayed Nazrul Islam Bridge.

4.26 Ship Building Industry

In Charchitala union, ship building emerged as new industrial activities. The south- western of food storage silo, on the bank of the river Meghna, this industry started with small scale activities. Since the area is riverine and skilled manpower is available, few business

entrepreneurs took initiatives to build a number of ships that may be sold or export for business and profit.

Conclusion

In conclusion, it is clearly said that the union has diversified activities. The urban and rural characteristics are instituted in the union. Modern economical transaction between the inhabitants and national- international organizations made the area more dynamics.

Chapter 5: Legal Framework

The different policies, strategy, direction and documents of the government have highlighted the consequence of land use and zoning for integrated planning of resource management of the country. Some of the important policy statements are mentioned below:

5.1 The State Acquisition and Tenancy Act 1950

According to the Section 90(2) of State Acquisition and Tenancy Act and section 326 of the Land Management Manual 1990, the agriculture land is not permissible to transfer in favor of non-farmers. Non-farmers are not allowed to purchase possess any agriculture land for business, commerce, industries, resident without the permission of collector. Even in classification change of farm land, during requirement, permission should be sought at the revenue officer.

5.2 The National Land Use Policy in 2001

The Ministry of Land formulated National Land Use Policy in 2001 to prevent land degradation and to ensure its best utilization. The policy highlighted the need for carrying out a national land zoning program for integrated planning and management of the country's land resources. The national land use policy (NLUP) 2001 emphasized (1) preventing the high conversion rate of agricultural land to non-agricultural purposes, (2) utilizing agro-ecological zones to determine maximum land-use efficiency, (3) adopting measures to discourage the conversion of agricultural land for urban or development purposes and (4) improving the environmental sustainability of land-use practices. The NLUP policy stated that agriculture products supply one third of national income and two-third of human living standards. Effective use of land can make sure the numeric contribution to the national GDP. Based on soil suitability, it is important to structures land zoning for controlling unplanned land use, preventing land degradation, preserving natural character and sustainable future. NLUP highlights need, importance and modalities of land zoning for integrated planning and management of land resources of the country. This policy also mentioned the need of formulating a zoning law and village improvement act for materializing the identified land zoning area. Planned use of land according to land zoning maps prepared on the basis of present and potential land uses will be ensured through enforcement of the provisions of relevant laws.

5.3 Sixth Five Year Plan (2011-2015)

One of the key strategic elements of the sixth five year plan is a firm commitment to pursue an environmentally sustainable development process. Natural resources like land and water are limited and their per capita availability is diminishing due to rising population and unplanned use of resources. Thus, the focus of the sixth plan's environmental management strategy would be the conservation and maintenance of natural resources. Land is the scarcest factor of production in Bangladesh. Better management of land is of paramount importance for sustaining rapid GDP growth in Bangladesh. Land is essential for agriculture, housing, urban, development etc. through ensuring best possible use. Planned use of land according to land zoning maps prepared on the basis of present and potential land uses will be ensured through enforcement of the provisions of relevant laws. The Government will take up projects for the development of rural townships where specific areas are to be earmarked for housing, marketplaces, industries and infrastructure. Land acquisition act and policy would be rationalized along with a system of fair and equitable compensation for acquired land.

5.4 Perspective Plan of Bangladesh (2010-2021)

The plan stated that seventy per cent people of Bangladesh live in rural areas and draw their income and employment from agriculture and related activities. Agricultural land is limited and is reducing at 1 per cent per annum. The government must promote sustainable land-use planning and innovative land management practices, with the objective of providing for the land requirements for rural and urban development through integrated and environmentally sound physical planning and land use.

5.5 The National Sustainable Development Strategy (2010-2021)

The National Sustainable Development Strategy (NSDS) 2010-2021, Bangladesh highlighted that land use in the country is diverse and often conflicting. It is intensively used for agriculture, settlements, forests, shrimp ghers, natural fisheries, salt production, industrial and infrastructural developments and tourism. Demand for expansion in all land uses (urban area, settlement, shrimp etc.); increasing demands for new uses (tourism, export processing zones and others); conflicting land uses and demands, and encroachment and conversion of land from one use to the other. The population is increasing and the land is being converted from directly productive purposes, such as crop cultivation, to other uses like housing and roads and urban development.

It is reported that cultivated land has been declining by almost one percent per year. Without effective measures to arrest this alarming trend the land available for crop production will continue to fall. Degradation of land refers to loss of its potential production capability as a result of degradation of soil quality and also its loss for effective use. The country loses about 10,000 ha of land to river erosion every year. This loss of land in a land scarce country has serious socio-economic impact.

5.6 Coastal land zoning policy 2005

Coastal land Zoning Policy 2005 highlighted the need for land zoning for the coastal area of Bangladesh. It describes about the need for definite guidelines and raises the possibility of doing coastal land zoning through an inter-ministerial task force. Zoning regulations would be formulated and enforced in due course. Through the responsible agencies, the Government will take proper plan and implement schemes for reclamation of balanced land from the sea and rivers.

5.7 The Territorial Water and Maritime Zones Act 1974

According to section six (06) of the Territorial Water and Maritime Zones Act 1974 of Bangladesh, the government may, with a view to the maintenance of the productivity of the living resources of the sea, by notification in the official gazette, establish conservation zones in such areas of the sea adjacent to the territorial waters as may be specified in the notification and may take such conservation measures in any zone so established as it may deem appropriate for the purpose including measures to protect the living resources of the sea from indiscriminate exploitation, depletion or destruction.

5.8 National Agriculture Policy 1999

National Agriculture Policy 1999 illustrated that government has the primary responsibility of ensuring optimum use of land. Although land is a privately owned property in general, its use has to be compatible with the overall social goals and utility. Following steps will be taken to ensure planned utilization of land:

- Land zoning programme will be taken up by the government on a priority basis. Integrated approach of government will be further strengthened for this purpose.

- To ensure maximum utilization of land, bottom up planning through people's participation and its implementation will be started from the mouza or village level.
- Fertile agricultural land is going out of cultivation due to its use for non-agricultural purposes such as private construction, house building, brickfield, etc. Appropriate measures will be taken to stop this trend in the light of the Land Policy of the government.
- Acquisition of land in excess of requirement for non-agricultural purposes will be discouraged.

5.9 National Fisheries Policy 1998

National Fisheries Policy 1998 avowed that lakes, beefs, ditches-canals and other open water bodies should not be completely dewatered. Water bodies would be renovated for fish culture and these would not be reduced in sizes. All water bodies primarily used for fisheries will be marked and their appropriate use will be ensured. Soil maps will be developed in almost potential fisheries areas of the country and prescription will be made available regarding requirement of lime and other manure.

5.10 Shrimp Strategy 2004

Draft Shrimp Strategy 2004 stated that the regulatory framework is essential to develop areas for zonation. Areas suitable for shrimp cultivation will be identified using a land zoning process which will limit brackish water shrimp aquaculture to coastal areas. The objective of land zoning is to optimize land use. The zoning process should therefore involve all stakeholder groups.

5.11 National Forest Policy, 1994

National Forest Policy, 1994 affirmed that attempts will be made to bring about 20% of the country's land under the afforestation programs of the government and private sector by year 2015 by accelerating the pace of the program through the coordinated efforts of the government and NGOs and active participation of the people in order to achieve self reliance in forest products and maintenance of ecological balance. Inaccessible areas such as slopes of the hills, fragile watersheds, swamps etc. will be identified and kept as protected forests.

5.12 National Industrial Policy 2010

National Industrial Policy 2010 described that environmental protection and preservation of aquatic resources are of utmost priority in the country which has a huge population and very limited land resources. The government will institute a land-satellite based system to map the land and water terrains in Bangladesh with a view to deciding allocation of land and water resources for industrial projects and to monitor land and water use, land water degradation, soil and beach erosions. For that Government will track major land, water and related industrial projects and their impact on environment and also create awareness among the public on environment protection, pollution, dumping of hazardous material on land and water. In these way, opportunity to positive efforts toward land and water protection as well as greening of the environment.

6.1 Findings and analysis

6.1.1 Classification of land according to Cadastral Survey (1958)

The Cadastral Survey was conducted in Charchatala between 1957 and 1958. The main objectives of the survey was to classify land, update land record and ownership, land management, counting land plots, measuring land, figuring out of mouza boundaries and so on. According to the CS mouza map and ROR of Charchatala, sixteen categories of land classes were found in the study area and the total land was 3586.2414 acre (appendix-2 & table-1.5). Cultivated land, river Meghna and homestead occupied 44%, 39% and 2.4% of total land respectively. The rest of thirteen classes of land occupied 15% of land of the union.

Table-1.5: Land use classification of charchatala union, 1958

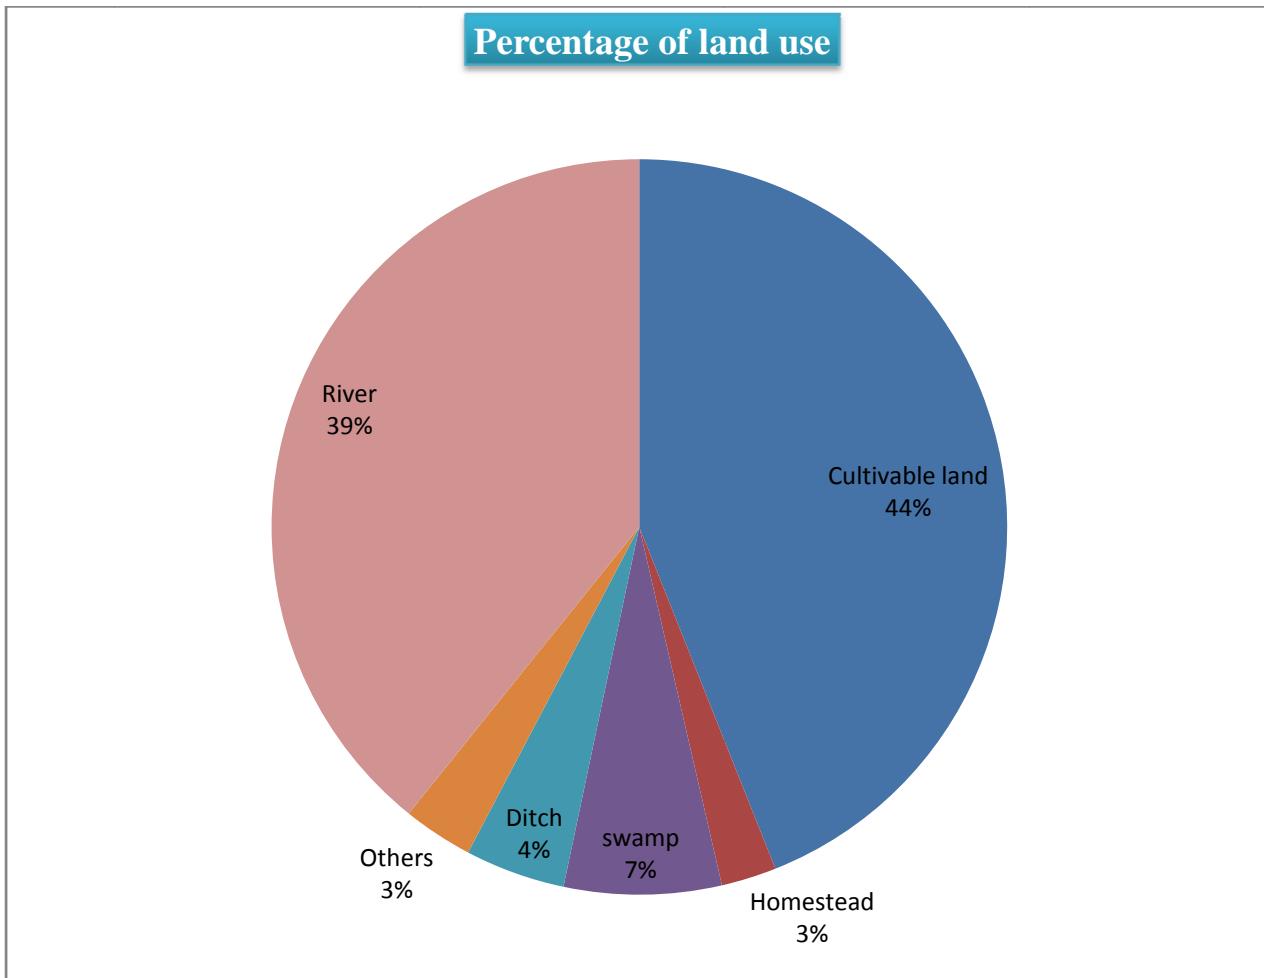

Land Class	Total land (acre)	% of land
Cultivable land	1576.95	43.97
Homestead	86.97	2.42
Storehouse	5.67	0.16

Total	3586.42	100.00

Source: Author compiled from union land office,
Asuganj, 2014

The table indicates that, fifty six years ago, the area was mainly dominated as agriculture zone. Four side of the union was shaped with the river Meghna and fertile soil favored agriculture crops with the assist of flowing siltation of the river Meghna during rainy season. Historically, the river has been flowing on the north-west and southern side of the union and it is also adjacent

to the Vhairab upazilla portion of the Meghna River on the west and north, Raipura upazila portion on the south-west, Nabinagar upazila portion on the south. The river is also in favor of agriculture product during wet season.

Figure-2.6: Percentage of land class in 1958

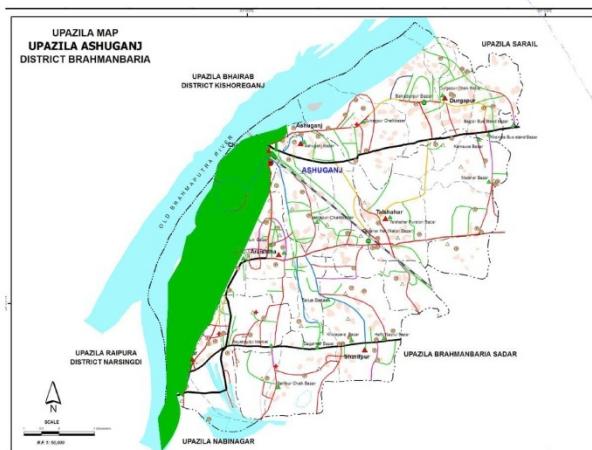

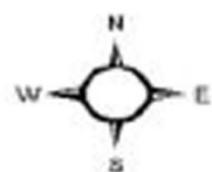

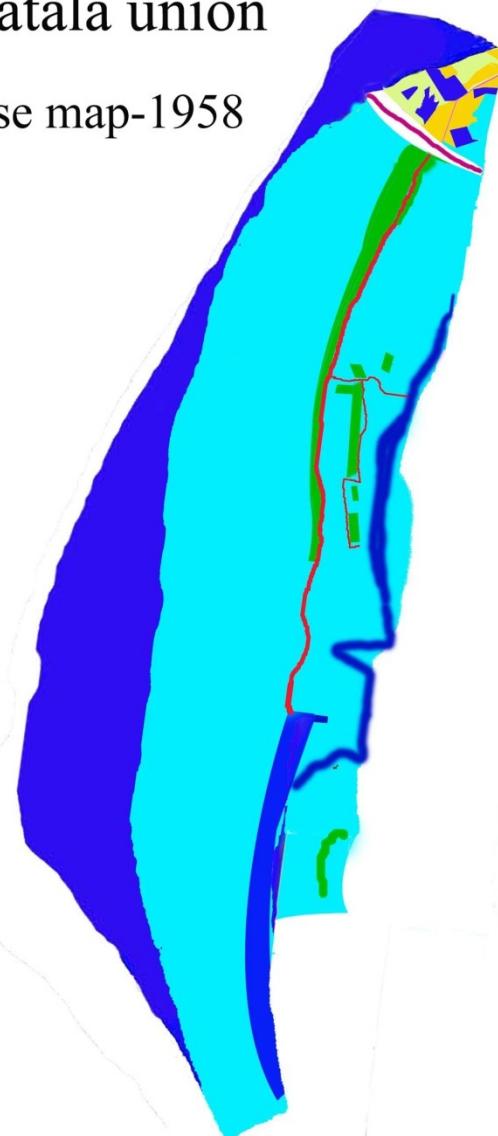

Sources: CS mouza map and land record of Asuganj sodor union land office, 2014

Farmers easily use water for their crops and meet up their feeding demand. The river Meghna is in favor of fisheries. From the Pre-British India, charchatla has been self-sufficient with fisheries and a number of fishermen are engaged in catching fish. Different types of fish have been catching from the river. A number of fishes are sold after meeting their daily protein. Riverine siltation, which make the land fertile, and its productive ecosystem support the life cycle of different fauna and flora of the study area. Since, the river covered 39% of the total area of the union; it can be called riverine area or fishing zone.

Charcatala union

land use map-1958

- Water body
- Cultivated land
- Homestead
- Urban area
- Road
- Bare land

The river also contributes a lot for river transportation. Heavy goods like stone, metal, paddy etc are transferred between eastern zone and capital city of this country. In 1958, agriculture land and revering area covered 83% of total land of Charchartala union. These two types of land class dominated the greater portion especially more than three-fourth of the union. So, it was clearly identified as agro-fisheries zone due to demonstrate as a mixture of agriculture and fisheries types.

6.1. 2 Classification of land according to Bangladesh survey (BS) (1995)

Bangladesh Survey was conducted the union in 1995. The total land area was remaining unchanged but the transformation of land class was remarkable. Public and private interventions' transformed the character of cultivated land to other uses. During BS operation, the number of land class reached from sixteen to twenty eight. Government important key performance indicator (KPI) for instance food storage silo, fertilizer industry, Compressor Station of Gas Transmission Company Limited (GTCL), power plant etc were instituted in this area and some new land classes demonstrated. For the purpose of installment of KPI, the government acquired a major portion of agriculture land which resulted alarming situation of agricultural product and environmental degradation of this area.

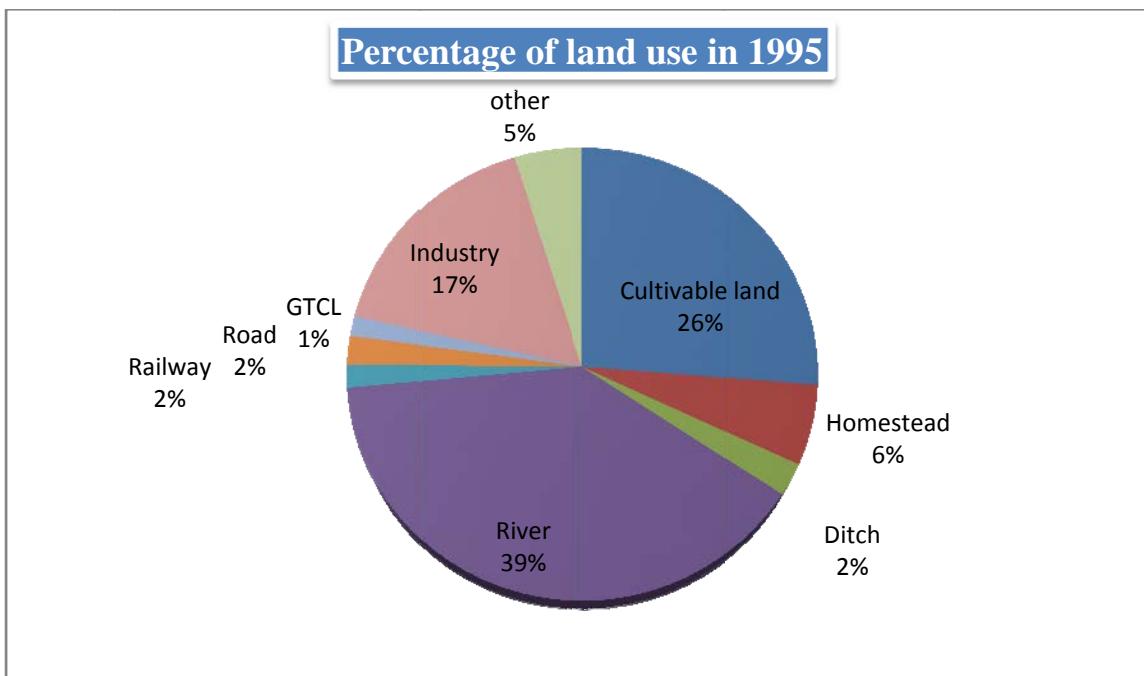

Table-1.6: Land use classification of charchartala union, 1995

Land Class	Total land (acre)	% of land	Land Class	Total land (acre)	% of land
Cultivable land	943.00	26.29	Mosque	0.9681	0.03

			Total	3586.42	100.00

Source: Author compiled from land record of Brahmanbaria settlement office, 2014

The table states that the highest landuse to be found river 39.15% and then agricultural and industrial land use ranks occupy 26.29% and 23.24% of the total land consequently. Besides these, residential, roads and railway, ditch and GTCL occupy 5.73%, 3.63%, 2.33% and 1.41% of land respectively. In this period, the land use patterns of charchatala union dominate as a mixture of fishing, agriculture and industrial types. These three dominate class occupy 82.05% of land and rest of 25 class of land occupy 19.95% land in the union. The rising rate of industrial activities has proved the growing proportion of industrialized and residential areas by transforming the agricultural lands. The road and rail network covers 3.64% of the union. The percentage of agriculture land reduced 17.68% over a period of 37 years and 596 acre of land was newly used for industrial purpose. So, the area would be identified as agro-fisheries-industrial zone.

6.1. 3 Land use pattern, 2014

The present land use pattern of charchartala union can be demonstrated as a mixture of agriculture, fishing, industrial and residential types. The union has been treated as the area of business transaction. The highest landuse to be found river 39.15%. Excepting the north-east side, the river Meghna flows surrounding the union. Then the industrial landuse ranks second highest occupying 19.79% of the total land use. About 22.27% of the total land area is used for agriculture purposes.

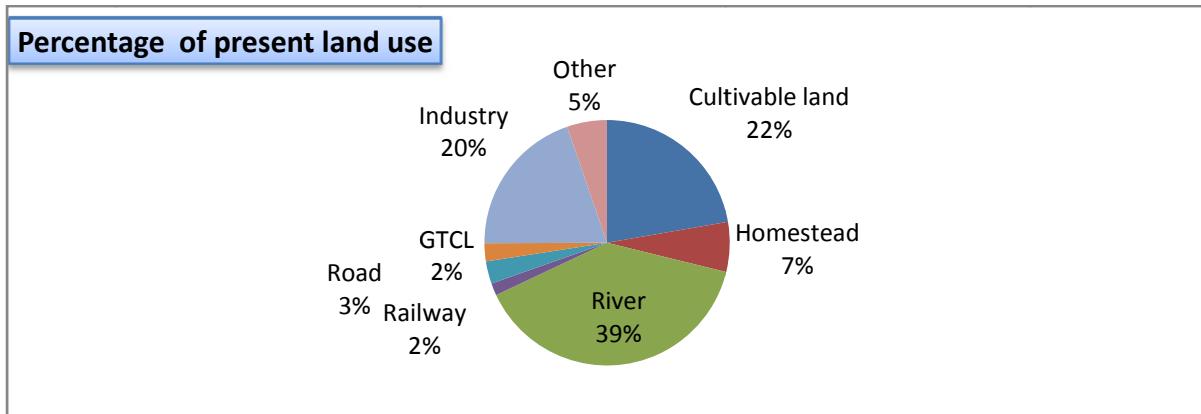

Table-1.7: Land use classification of charchartala union, 2014

Land Class	Total land (acre)	% of land	Land Class	Total land (acre)	% of land
Cultivable land	798.90	22.27	Graveyard	5.84	0.16
Homestead	235.28	6.56	Silo	27.43	0.76
Swamp	6.38	0.18	GTCL	85.12	2.37

Source: Land use survey, 2014

The main agriculture block is found in ward 3, 7, 8 and 9. The compressor station of gas is located in ward 3, Asuganj fertilizer industry is found in ward 6 and 8, the river is adjacent to ward 2,3,7,8 and 9, and residential area is found in ward 1,2,4,5 and 9 of the union (appendix-8).

Figure-2.8: Percentage of land class in 2014

Source: Author compiled from field survey, 2014

The increasing rate of industrial and commercial activities in and around the union has resulted in the growing proportion of residential areas within the semi-urban limits by transforming the remaining portion of agricultural lands. The industrial and commercial use of land occupies some portion of existing water bodies in the area. Residential area covered 7% of land. A new class of commercial use of land for instance rice husking mill, added with the existence class that occupied 14 acre of land. There are some other governmental institutions like food storage silo, power plant, rail way station, river port, launce terminal, GTCL, Dhaka-Sylhet highway; market etc is found in the study area. Now the road and rail network covers 5% of land. There have no forest in the area, where a small number of homestead forest also has been struggling for their survival. Due to the semi-urban character, land owners willingly construct new residence on modern structure. In terms of geographical setting and better communication with the eastern portion of the country and neighboring country India, the government of Bangladesh has been constructing a land port in the union. This port will make the area dynamic and will create commercial transition. Historically, the river Meghna familiar the union more business and strong ties with rail and road network from the south-eastern portion to the capital city of Bangladesh.

6.1.4 Changing land use pattern in char chartala union over time

According to the nature and extent of the study area and diversity of its land uses, 30 categories of land class have been found for three selected years (1958, 1995 and 2014).

Table-1.8: Land use pattern in different years of charchartala union.

Land Category		SA operation, 1958		Bangladesh Survey, 1995		Field survey,2014	
		Area in acre	%	Area in acre	%	Area in acre	%

Source: Author compiled from land record and field survey, 2014

* (--) indicates that (30-16=) 14 land class has added after BS operation to field survey

It is mentioned here that in 1958, the area of charchartala had sixteen land use classes which extended into thirty in 2014. Over a period of fifty six years, the union is diversified from monopoly agro-fisheries to heterogeneous activities.

6.1.5 Favorable location and changing land use classification

Charchartala is located between Brahmanbaria sodor Upazila and Vhairab Upazila which are very important for communication, transportation and business issues from the capital city Dhaka to the south-eastern area on the country. Such favourable location of the union plays a vital role in the landuse changes of the area. Landuse change is occurring due to excessive pressure on land for settled of seven Key Performance Indicator (KPI), development and establishment of infrastructure, commercial establishments, and human settlements. Expanded KPI set up and other activities promoted its growth from a village to a commercial semi-urban area and finally as a multifunctional place. These kinds of development of the union have a profound effect on landuse change. The union has better road, rail and river network with several districts and direct connection with the capital city. As a result the product, that local

entrepreneurs and government KPI produce, can easily transfer to other side of the country which resulting the change of land use pattern of the area. The rise of land value in charchartala also affects the landuse pattern. Highly valued land in KPI, residential and urban area is used by high income group. Considering land value some residences in the urban area are converted into commercial uses especially market, shop, private office, bank etc. Different categories of landuse including residential have been developed in the urban and village area of the union because of high value of land. The business and administrative importance also increased. Seven KPI, private business, private bank and other government and non-government institutions have been established in the area. As a result, the mobilization of resources and their positive effect creates many employment facilities in the area. A large number of potential working populations from several district of Bangladesh especially greater Mymensingh, Noakhali, Rongpur, and Jamalpur temporarily live here for several pull factors including employment facilities of the study are. It is observed that these temporal migrated people engage to build industrial development, business activities, infrastructure development etc. which change the land use pattern. Globalization is an international factor which creates tremendous influence on landuse pattern and their changes in Charchartala as it works as a pull factor to reside in the union environment.

Table -1.9: Changing landuse pattern of charchartala, 1958-2014

Source: Compiled from mouza map, land record volume and field survey, 2014

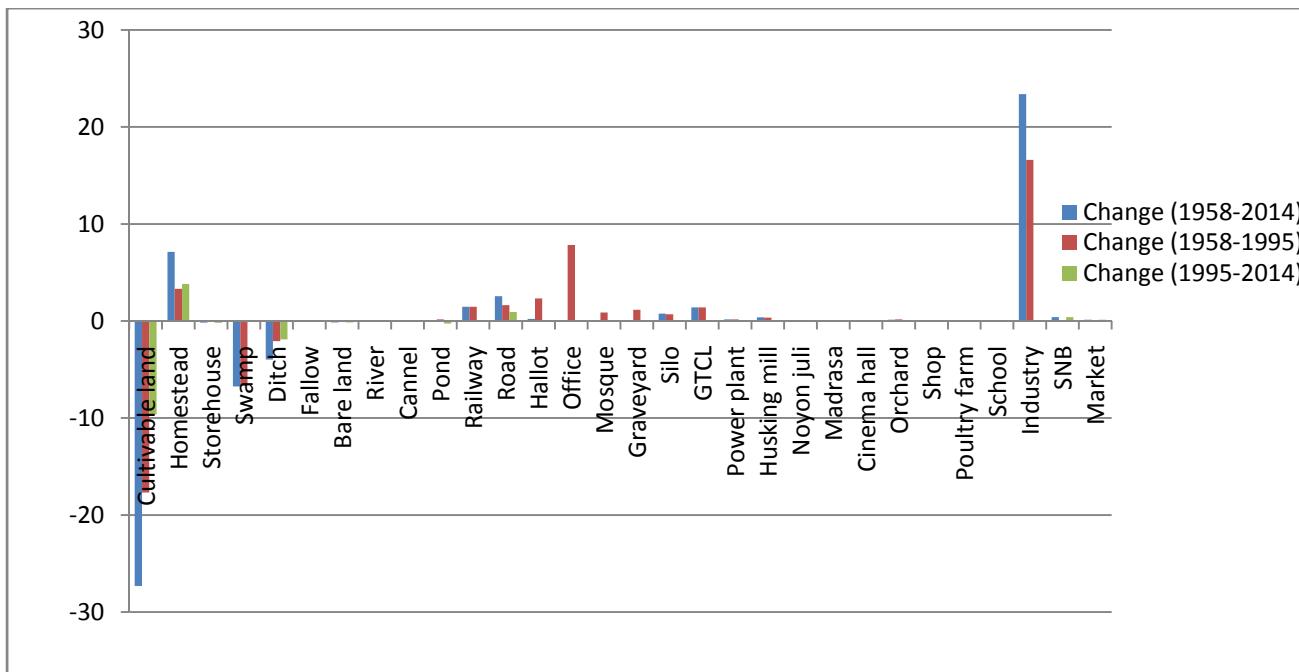

It is observed that the agriculture land has been decreased 22% over a period of 56 years which is more alarming for the agro-based country like Bangladesh. The negative effect of decreasing character of agriculture land was 18% between CS and BS operation, where it reduced again from the rest of agriculture-land 4% between BS operations to present study. The cultivated land is shrinking on at the rate of about 0.39 percent per year. A rapid and remarkable change has been observed in industrial landuse. In 1958, no industry was built in the area whereas presently round 23% positive change has occurred this type of landuse. That means 23 % of the new industrial area has added, till 2014, to the zero industrial area of 1958 (Table-1.9). Besides, residential or homestead area has positive change in the union which is 5% during the five decades. New residential area has developed using agricultural land, fallow, bare land and open spaces for providing housing facilities to the increasing population. The low income group residential area has declined than that in the previous two decades. But high and middle income group residential area has increased recently. Historically, the northern part was for residential and commercial use; the north- east and south-east portion was used for homestead. During six decades, in the northern and north-east part of the union, the density of residence has increased.

New residential areas have been establishing in rural area transforming agricultural and fallow land. Commercial activities are one of the most important dynamics of the union. It cover husking mill, farm, SNB, market etc. Commercial landuse and its changes have been observed with the growth of the study area. The commercial land of charchartala grew positively by 1.81%, 0.53% and 2.36% during the period of 1958-1995, 1995-2014 and 1958-2014 respectively. Mixed types of land use for example shops, banks, restaurants, office of the different institutions, cinema hall, rail station, bus stoppage have been established gradually since independence in the urban residential, commercial and rural area of the union. Thus, the presence of landuse has been diversified in the research area.

6.1.6 Dynamics of land use change

A significant change observed in land use pattern of the study area in respect of agriculture land, homestead land and industries area. Agriculture land of charchartala union is negatively declined by 18%, 4% and 22% during 1958-1995, 1995-2014 and 1958-2014 respectively.

Figure- 2.9: The Dynamics of landuse change in charchartala union

Source: Author compiled from different sources, 2014

Industrial landuse of charchartala is positively increased by 17% and 23% during 1958-1995 and 1958-2014 respectively. Before independence, charchartala had only food storage silo. With the importance of time, the union has become an ideal place for KPI, business, fishing and

agriculture product. Settled of KPI's has risen of land value in the union. Agricultural land, fallow land, bare land, ditch, old pond and water bodies have used for settlements in terms of residential, commercial, road network etc in the union since 1958. With the passage of time, the growing population and the faster economic activities have increased and it reduces the amount of agricultural land of the union. The remarkable change in agricultural land is observed in the middle-south-western and north-eastern side of the union. The rapid conversion of agricultural areas to non-agricultural uses is more pronounced to the north of the union than to the south. The loss of fertile agricultural land is non-recoverable because much permanent construction has been undertaken. Significantly, the land where no permanent construction has taken place, i.e. that which is lying vacant, can be recovered but it will not be an easy task to restore this land back to agricultural use. Most of the agricultural lands are converted into KPI, settlements and mixed type of land use. Fallow lands, bare land, ditch land of the area are gradually transformed into settlements in terms of residential, commercial and Government development institutional etc. A number of ditch, swamp, tanks, and ponds were available in the urban portion of the union but with the necessity of settlements for increasing population, these water bodies were filled up over the years. There is no change of open water bodies for instance, river Meghna since 1958. The proportion of administrative landuse in the area is increasing remarkably. The changing pattern of landuse of the city can be summed up by saying that increase of industrial, residential and commercial area is responsible for decreasing agricultural landuse. Rural agriculture is one of the ways to the supply of food grains and vegetables to the residents of the village and cities in the country. The nature, type and magnitude of transformation of agricultural lands to non-agricultural activities may have a profound effect on food security of charchartala union. Charchartala area lies on fertile land of peripheral river Meghna from the four side of the union. The riverine based union is in favor of agriculture and fisheries. At present, its present development is due to its commercial role. It has well developed KPI, business activities, river port, highway and railway transportation system etc which made the area more dynamic. In considering various development activities, the area can be called as trade center or trade zones. In the last few years, as new commercial activities have developed, the union and its surroundings have undergone radical changes, including the development of its built-up area and a transformation in its population's occupational structure. Historically, Asuganj has been

recognized as a center of trade and commerce. Due to its easy means of communication and transportation, an agglomeration of commercial activities developed at the bank of the Meghna.

6.1. 7 Changing occupation

Remittance is one of the life lines of Charchatla economy. The remittance has significant macroeconomic impact at household level. A number of potential young and skilled people of Charchatla are working abroad. During the construction of fertilizer industries, GTCL, Vhairab Bridge and their connecting roads, a number of local young potentials were working in those institutions. The young potential grew their technical skill and went to abroad specially Japan, Korea, and Middle East etc and utilized their skill and efficiency. Most of their remittances sent to the country for various livelihoods such as residences building, disbursement of small loans, living expenses, business, medical treatment and funds for asset purchases. Since then, they have been making separate residences reducing the agriculture land. Besides, a number of local entrepreneurs established rice husking mill in the area. As a result, many day labors work in their mills. Likely, many labors do outwork business in river ports, infrastructures development and so on. In such way, the occupation became diversified from agriculture to others year after year.

6.1. 8 Acquisition of land and development of the union

According to the land acquisition report of upazilla land office, Asuganj, 19% of land was acquired for development purpose during last five decades. It is mentioned here that man and land ratio of the union is 1:0.15 acre (BSS, 2011 and Survey Report, 2014). Due to construction of fertilizer industry and GTCL, 25% (table-1.7) of land was acquired by the government. The local farmers lost their factors of production. It is also mentioned here that the fertilizer company could not use their major acquired land for productive purpose and half of the acquired land remain vacant. As a result, the number of land owners decreased and since then ex farmers have been living the vacant land and producing agriculture crops by the contract with Fertilizer Company.

Table 1.10: Acquisition of land for development purpose

6.1. 9 Shifting trend of major land classes

During five decades (Table 1.9), the yearly average declining trend of agriculture land is 0.39%.

On the contrary to say that, yearly, a remarkable number of lands have been used for industrial function while no alluvium or diluvium occurred during the period. There has been a significant increase and decrease of industrial function and agriculture products.

Figure- 2.10: Shifting trend of major land classes

Source: Compiled from different sources, 2014

From the study, it can be said that the industrial use of land was positively increased. The industrial extension made the area more diversified. Income sources also transformed from single to different layers. Agro based rural society transformed into non-farming nature. It is also observed that the trend of homestead was sharply increased during the decades.

6.2 Land zoning process: An analysis for land use policy

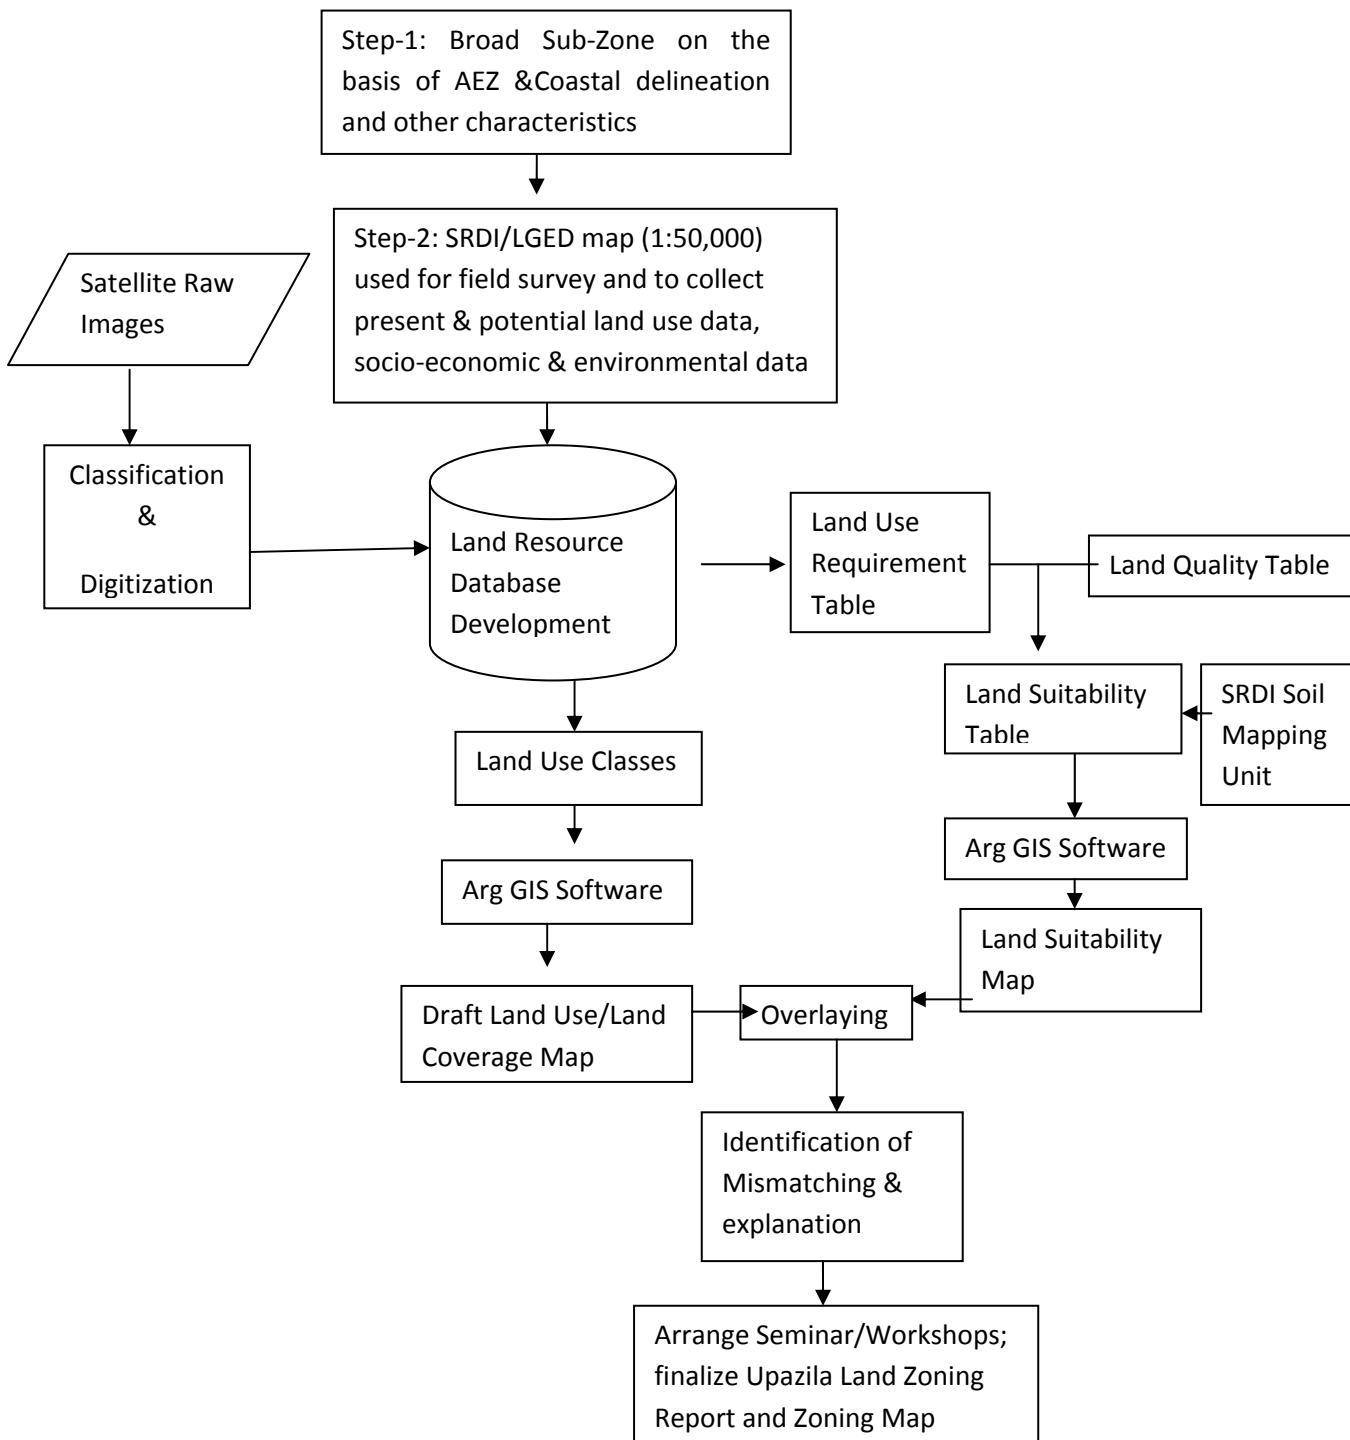

The National Land Use Policy 2001 is an important guideline of the government that emphasize on effective use of land in considering the factors of production and sustainable development. National land zoning project is a tool for initiating and implementing the planned use of land. The project started in 2010 and will finish middle of 2015. For assessing the land to its best possible use, the main objectives of the project is to prepare digital zoning map and to develop land zoning data base and management information system that will prevent land degradation, preserve and protect eco-system and reduce land conflict. The Ministry of Land is responsible to implement the project. The project will mainly identify major land use like agriculture, fishing, forest, tourism, rural and urban settlement, industrial and commercial areas for zoning maps. After completion of all upazila zoning map, countrywide the government, by the Ministry of Land, will promulgate a land protection act.

6.2.1 Process of land zoning activities

The whole process of land zoning activities could be summarized below:

- Review and evaluation of the relevant data derived from different sources;
 - Inter-agency consultation meeting at district level;
 - Discussion meeting at upazilla level;
 - The LGIs persons and other relevant upazilla official are discussed and trained for helping data collection and draft map preparation at union level;
 - Secondary data especially Satellite images collected from SPARSO for classifying existing land use and other important features;
 - Field Survey
 - Upazila-wise SRDI and LGED base map as a reference guide for land use mapping;
 - Field survey with LGIs and other relevant upazilla officials including union Porishod chairman to collect data and demarcation of maps on present land use at union level;
 - Land zoning data and other information collected on the basis of semi-structured questionnaire/checklist;
- Collection of union -wise land use coverage on agriculture, fisheries and forestry through field observation (LZR, 2011).

Figure 2.11: Flow chart of land zoning methodology

Source: Land zoning report, 2011

6.2.2 Analysis of the zoning process

Developed countries implement zoning process in urban areas. Local institutions implement the process through homeostatic approach.

In Bangladesh, where zoning is the ex entry stage, the government is thinking to initiate land zoning plan. Land zoning project is the first pace to invite policy makers and implementers for ensuring efficient use of land. Countrywide, the project works in rural areas. The metropolitan areas and local municipalities are directed by the Town Improvement Act 1953 and Municipality Act 2009 where the provision for use and development of lands are included. The zoning project works rest of the areas (except Chittagong Hill-Tracts). The zoning process demarks the union and upazilla boundaries based on topographical use of land that instituted from ground truthing and second hand data which included into LGED map and prepare zoning areas. The process considers present use based land and proposes to conserve the remaining areas for efficient use in future so that unplanned use or haphazard degradation may not allowed for the betterment of land owners and environmental sustainability.

Though the land zoning project has been functioning since 2010, it cannot prevent present unplanned use of land due to not formulating policy and their implementation. In charchartala, where the land zoning project completed its tasks, a number of agriculture land were converted to non-agriculture uses by land owners and grabbers. These conversions occurred after the completion of zoning project. But it is alarming that no steps had been taken to prevent these unintended activities.

The zoning process prepares to shape the zoning map in considering land suitability, crop suitability, land class, water suitability, land use etc for the concern area. It does not go for detail observation. Presently, the project works up to union level. It has no scope to go for plot to plot survey or mouza survey for analyzing holistic point of view. Beside these, current GIS map are rare to find for comparing with ground truthing which makes gap between the practical ground truthing and geographical information system. For the actualization of details information the gap sometimes make the process inconsequence.

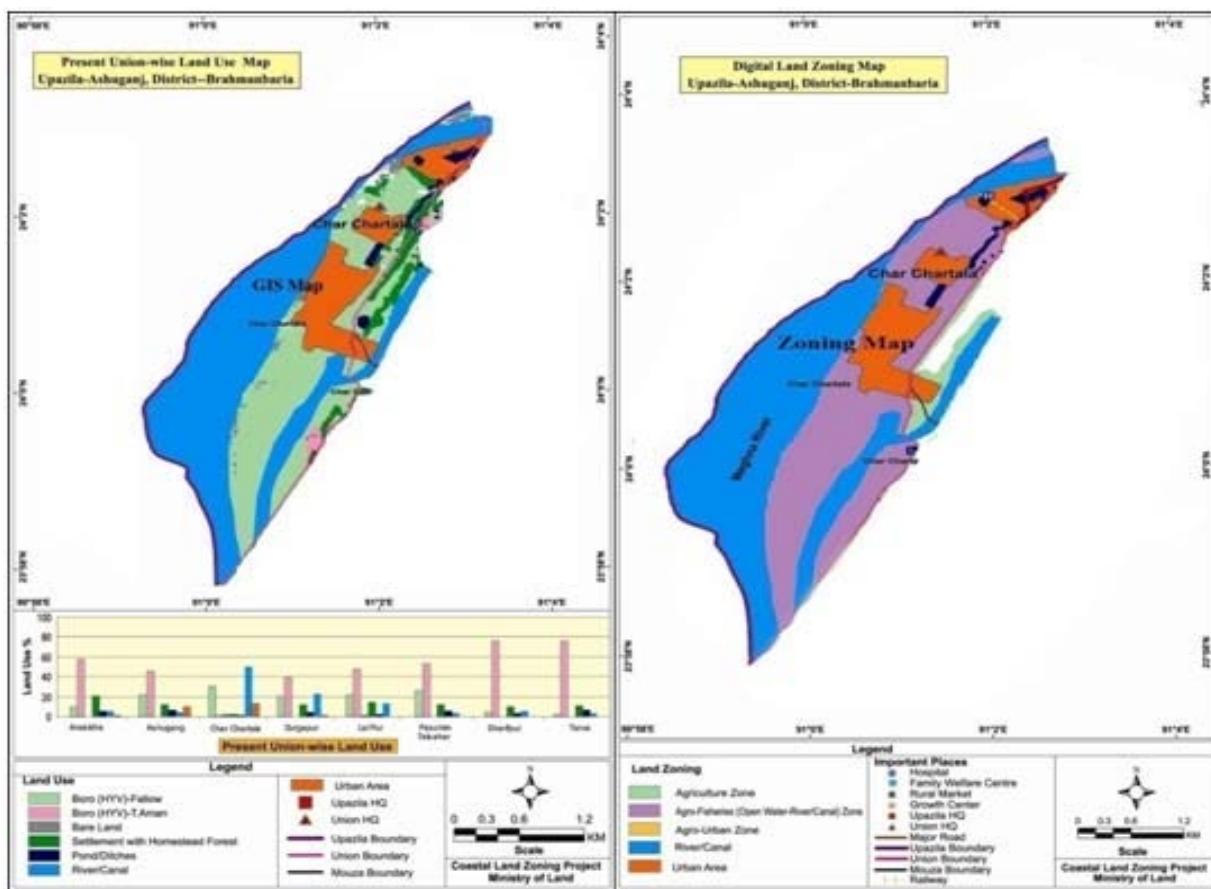

6.2.3 Comparative analysis of land zoning and survey map

During survey, it was found that there are many things to analyze the zoning and survey maps.

6.2.3.1 Faster change of zoning map

Zoning process projected in the study area between the years 2010 and 2011. The zoning map and MIS was completed in 2011. GIS and LGED map used for visualize physiographic features of specific area. During the operation of the project, in respect of land use, the area was belonged to its dynamic character. Continuously, unplanned conversion of land class was the common activities. After a period of three years, the land use pattern changed remarkably (Map-3.2). The converters and agencies did not take into consideration the zoning map for transformation of agriculture land. People are not aware of the zoning map and process. Even though, zoning map and MIS was unable to prevent and protect the devastating alteration of agriculture land to non-agriculture activities. For instance, government acquired 17.31 acre of agriculture land for construction of land port. The acquired land has already transformed to land port (table 1.10 & appendix-3, 4, 5 & 8). These transformed land plots are positioned between GTCL and food storage silo. The area is recognized as agriculture zone in the GIS and zoning map. But, presently, the area is used for port land. Besides these, in the ward 4, 5 and 9, more than thirty acre of agriculture land converted into homestead (apperndix-8). The land use patterns had been changed rapidly for last three years. Due to not formulating sustain policy and their implementation; zoning map cannot remain her stable features. If it continues, the area will convert distinctiveness that will not be possible to control by forthcoming law.

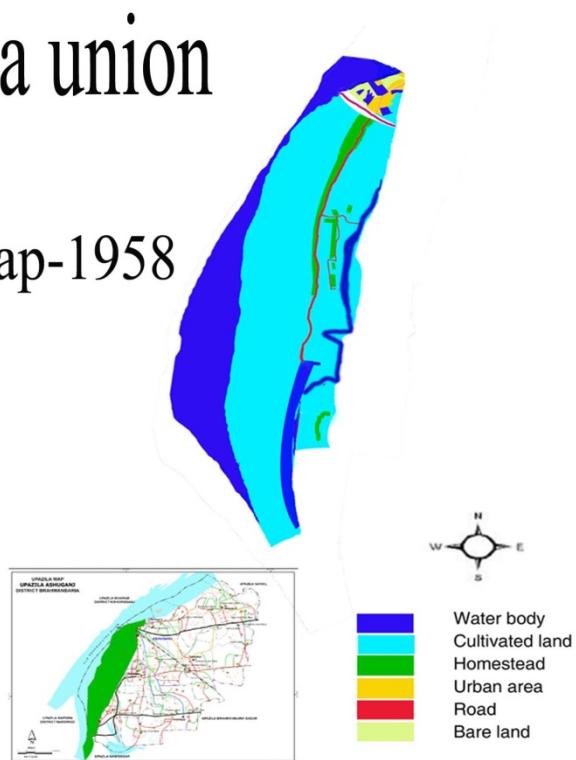

Map-3.2: GIS, land zoning, CS, BS and survey map

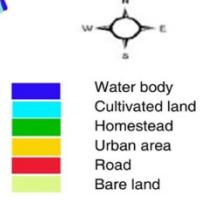

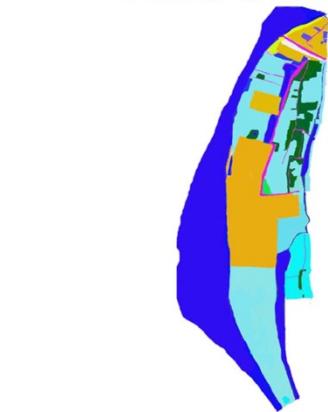

Map-3.3: GIS, land zoning, CS, BS and survey map of charchartala union

Charcartala union

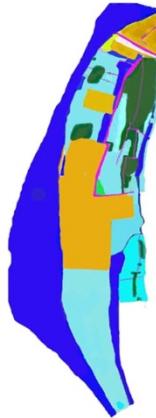

Land use map-1958

Land use map-1995

Land use map-2014

6.2.3.2 Assessment of agro-fisheries zone

Agro-fisheries zone is the diversified combination of agriculture and fisheries activities. According to the survey, 61% of lands are used for agriculture and fisheries purpose. During the rainy season, this area covers with water. The flowing water of river goes over the cultivated land. A large variety of fishes and other aquatic organisms live in the river. Many Riverine fishes expand their living area and easily move to the plain land for their feeding, living, breathing, hatching etc. During rainy season, floras and faunas may create natural ecosystem for sustainable livelihood. But it is a matter of fact that, only 2% of local population are dependents to some extent on fisheries ((UFO, 2014) and no fishes to be exported or any numerical figure yet to be found from the area. Statistically, no upwards and downward trend to be figured out of fishing cultivation. On the one hand, no strategy has been taken to make the area as fishing zone. Furthermore, released ammonia gas of fertilizer industry is disfavored of the fishing cultivation. Besides, water bodies like ponds, lakes, ditches, swamps have been decreasing year after year and a small number of fishermen depend on fishing. In addition to say that there is no formal fishing management or fish cultivation system in the area. It was observed that, the eastern part of the union could be used for fish cultivation. This part is unused and no plan be taken to make this area productive. Fisheries sector can play significant role for employment, nutrition and export earnings in the economy of the area.

6.2.3.3 GIS map and in-depth observation

Land zoning map was made without consideration of ground truthing, in-depth observation and examination. Most cases, GIS map converted into zoning map with some rectification. A gap between GIS and land zoning map has been found in the study area. Though, GIS was the preliminary bench mark for preparing zoning map, lack of in-depth observation for practical ground truthing; the zoning map could not demonstrate its solid phase. As a result, notable differentiations have been found between GIS and survey map. For instance, the urban area stands on the north of highway. In GIS and zoning map, a number of ponds and ditches had drawn out in the urban portion. During survey, no water bodies were found in urban area. After BS operation, the water bodies were converted into homestead, commercial and urban uses. It

can be clearly said that the GIS map that used for land zoning project was so old that could not trace out the present sceneries of the area.

6.2.3.4 Mis-interpretation of homestead area

The homestead area of north-eastern portion of the union was missed out in zoning map. The homestead area had shown as cultivated field in the zoning atlas. For instance, the north-eastern corner, ward 1 and 2, from highway to the southern residential area was homestead and the housing pattern of this area was same as the urban area. During survey, this area was identified evidently homestead. Some homestead forestry also found in the area. But the area was imperfectly identified as agriculture zone in the GIS and zoning map.

6.2.3.5 Mis-defining Industrial area

In zoning map, industrial area wrongly defined as urban zone. For example, the area of fertilizer industry, GTCL, food storage silo and land port were zoned and planned for industrial development. This area is located on the edge of river Meghna. It is outside of the urban portion and provided with good transportation access including river, road and rail network. Excepting the residential colony of fertilizer industry, the whole area is roofed with industrial features and functions. In zoning map, the area outlined as urban region ([map-4](#)) while the basic characteristics of urbanization for instance social organization, educational institution, human settlement etc was absent in that area. The area can be called as industrial zone.

6.2.3.6 Mis-positioned of water zone

In the eastern side of the union, a long open water body (south to north) of the Meghna River entered into the union that reached to the highway road. The water body is positioned in charchartala union. It is also indicated in the mouza map of CS and BS operation in 1958 and 1995. The shape of water body is as it was and no change takes place on the course of the river during the period. But, in the GIS and zoning map, the northern part of the open water body of eastern Meghna River was wrongly positioned in Arshadia union. As a result, the comparison between field survey and GIS and zoning map takes attention to the policy maker to carry out the zoning process more practical and ground truthing manner.

6.2.3.7 Lack of holistic view

The zoning process couldn't apply the homeostatic approach. Under the limited view point, the process didn't cognize incremental adjustment through addition, subtraction or correction in consultation with expertise, local stakeholders, professionals etc. Even, the number of seminar, workshop and meeting in district level were so limited that couldn't build up awareness to land users and owners. Likely, no meeting or workshop carried out in the execution area especially the village, union and upazilla level for building awareness among the land owners. The zoning process couldn't able to stop the illegal encroachers on land and fail to invite land developers, grabbers and illegal occupier into the process. The zoning project doesn't cover holistic techniques that could make it more prolific and sustainable for further policy formulation. On the other hand, ignoring socio-economic condition, environment, demography, people's perception, experts and professional's engagement, the process couldn't able to figure out the holism for its sustainability.

6.2.3.8 Synchronization and diachronization

Synchronization refers to the facts of living system as it exists at one point in time without reference to its history. The GIS and zoning procedure don't consider the chronology of historical land use and their change over time that could be built a historical physiography of land and her uses. On the other hand, diachronization includes and uses of a phenomenon as it changes through time. The survey report tries to figure out the diachronization by addressing three periodical land use and types.

6.2.3.9 Zoning process avoided urban area

Countrywide, the land zoning project skipped urban areas, municipalities, metropolitan areas, the area that has already changed its structure and the capital city of Bangladesh. The urban metropolitan area is directed by the Town Improvement Act. For the urban metropolitan area, the detailed are plan (DAP) doesn't work for various constraints. Likewise, municipalities are controlled by the municipality act. Chittagong Hill Tract is governed by the local customary laws. Without considering the severity of urban area and their impact on population and other

socio-economic circumstance the land zoning project partly initiated the process for the country which may not create effective result for the sustainable land use planning for the country.

Chapter 7: Compulsory Efficient Use of Land (CEUL) model

Introduction

Compulsory Efficient Use of Land (CEUL) model is a tool for optimum land use and planned zoning in Bangladesh. The CEUL model may help the government to her land use for sustainable development. The CEUL provides a new guideline on multipurpose land zoning system through efficient use by utilizing systematic tools, techniques, information, technology and finally governance. The CEUL model can be used as a implementing tool of public policy in order to regulate land use in an efficient and ethical way, thus preserving agriculture land, planning land use, maintaining ecosystem and preventing land-use conflicts. The government may use CEUL model to manage the development of land. In doing so, the government can plan for the needs of the society while developing land, safeguarding ecosystem and natural resources. It is the systematic assessment of land, forest, homestead, resident and water potential, alternatives for land use, and economic and social aspect in order to select and adopt the best land-use options. The CEUL may provide a vision for the future possibilities of development in urban and rural area of this country. The CEUL model may influences the scientific, rational, planned and orderly disposition of land, resources with a view to securing the natural, environmental, physiographical, economical and social efficiency well-being of urban and rural communities in Bangladesh.

7.2 Significance of the CEUL model

Scarce land and the rapid increase of population of the country are creating high pressure over land-man ratio. The governmental land use policy has no punitive measure to control the situation. As a result, unplanned and spills out jumbled of cultivable land throughout the country makes terrible condition. Land management, settlement and registration are governed by the public sector of Bangladesh. The government does not keep position for second (NGO) and third (civil society) sector for managing land governance. The government didn't take any initiative to control unplanned land use and land degradation. Though, coastal land zoning policy enacted for the best utilization of coastal land and water for sustainable living and environmental protection in the coastal area, it did not see the sunlight due to lack of compulsion, punitive measure and integration. Beside this, a number of policies were acted out by the government since long, but their implementation and output is not up to the mark. Without commitment, integration,

inclusiveness and compulsion of the policy process among governmental agencies it is impossible to shape the country sustainable land use. After realization of all fogy activities, in considering the country's safeguard and hers people's potential, it is crying need to take initiatives for compulsion efficient use of land(CEUL). In these circumstances, it is important to impose a compatible compulsory efficient use of land (CEUL) system for establishing planned land use for the country.

7.3 Description of the CEUL model

The CEUL is a set of governing tools that depicts how the present unplanned land use pattern can be transformed into designed land use manner (DLUM) with efficient way for optimum gain. The model is most accountable and feasible systematic approach for planning and developing an up-to-date land use system for overpopulated country like Bangladesh. The model is related to various qualitative and quantitative aspects of land resources. The CEUL model includes four major layers (Figure-2.12) that are structuring and need analysis, piloting, policy formulation and governing the process. Compulsory Efficient Use of Land (CEUL) is defined as collection of land use data and analysis with relation to GIS, LGED and Mouza map towards a management information system (MIS) for obligatory designed plan and policy formulation for competent land use. When MIS with policy formulation and implementation will be governed compulsorily for all, it will term as Compulsory Efficient Use of Land (CEUL). First of all, under the umbrella of land ministry, for structuring the model, CEUL application involves digital survey methods by DGLR, geographic information system (GIS) by SRDI and plot to plot survey by district land administration & management department (Figure: 2.13). The digital survey (DS) and plot to plot survey (PPS) based on ground truthing while the GIS based on current satellite images will be adopted. Completion of these three operations would provide inclusive draft geodetic maps and information system. Gap analysis, blending three maps and IS combined into one makes a mingling shape of geodetic map and MIS. After that the drafted maps and MIS displays before public space for hearing, editing, correcting, modifying and finalizing. Then the final maps and MIS would preserve centrally for inclusive geodetic map, networking, using, policy formulating and so on. In consideration and prioritization of saving cultivable land and natural resources, an efficient design should be adopted for housing, infrastructure, market, office, institution, water bodies etc where cultivable land will not use.

Figure 2.12: 'Compulsory Efficient Use of Land' (CEUL) model

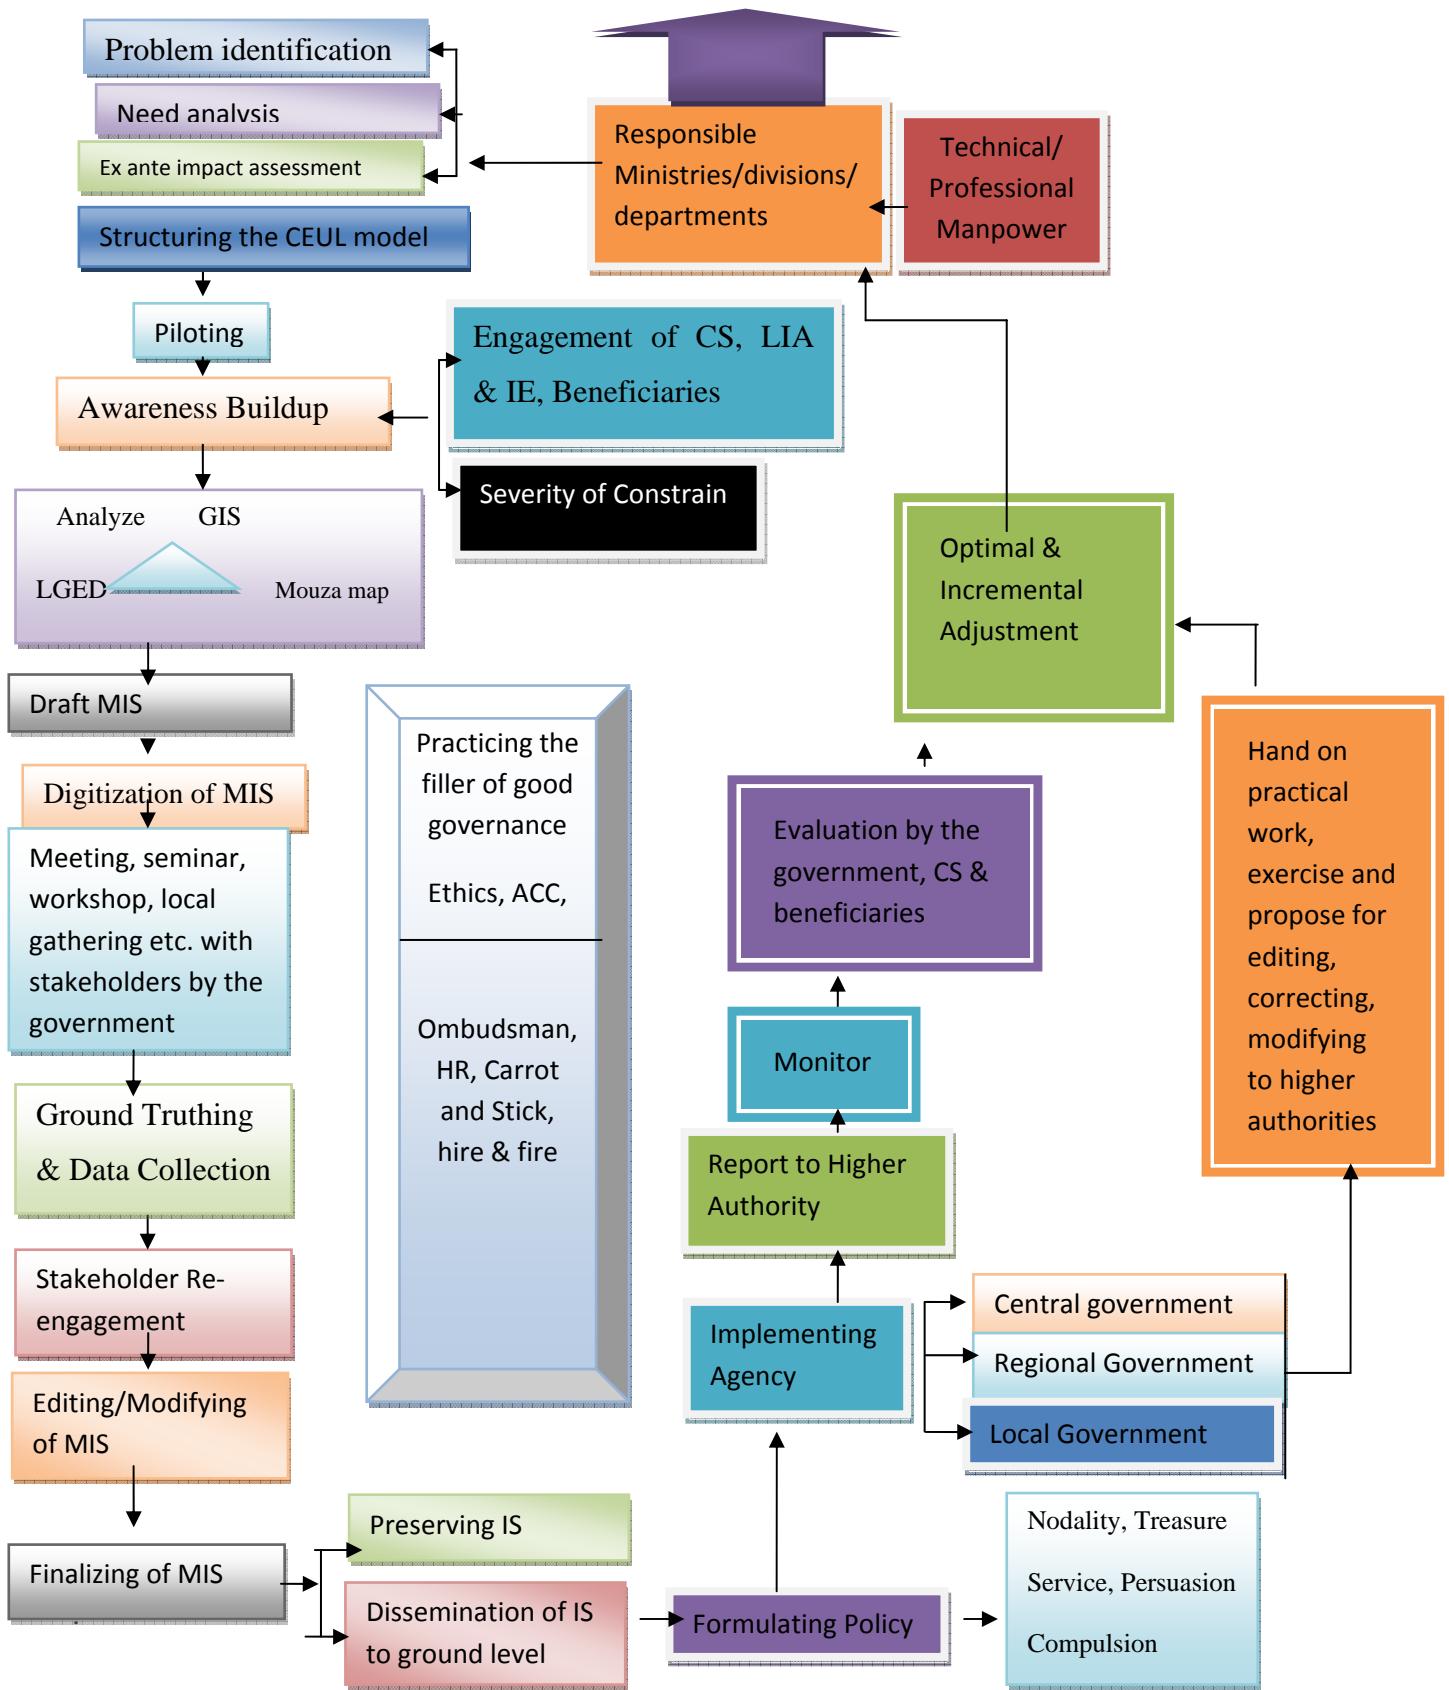

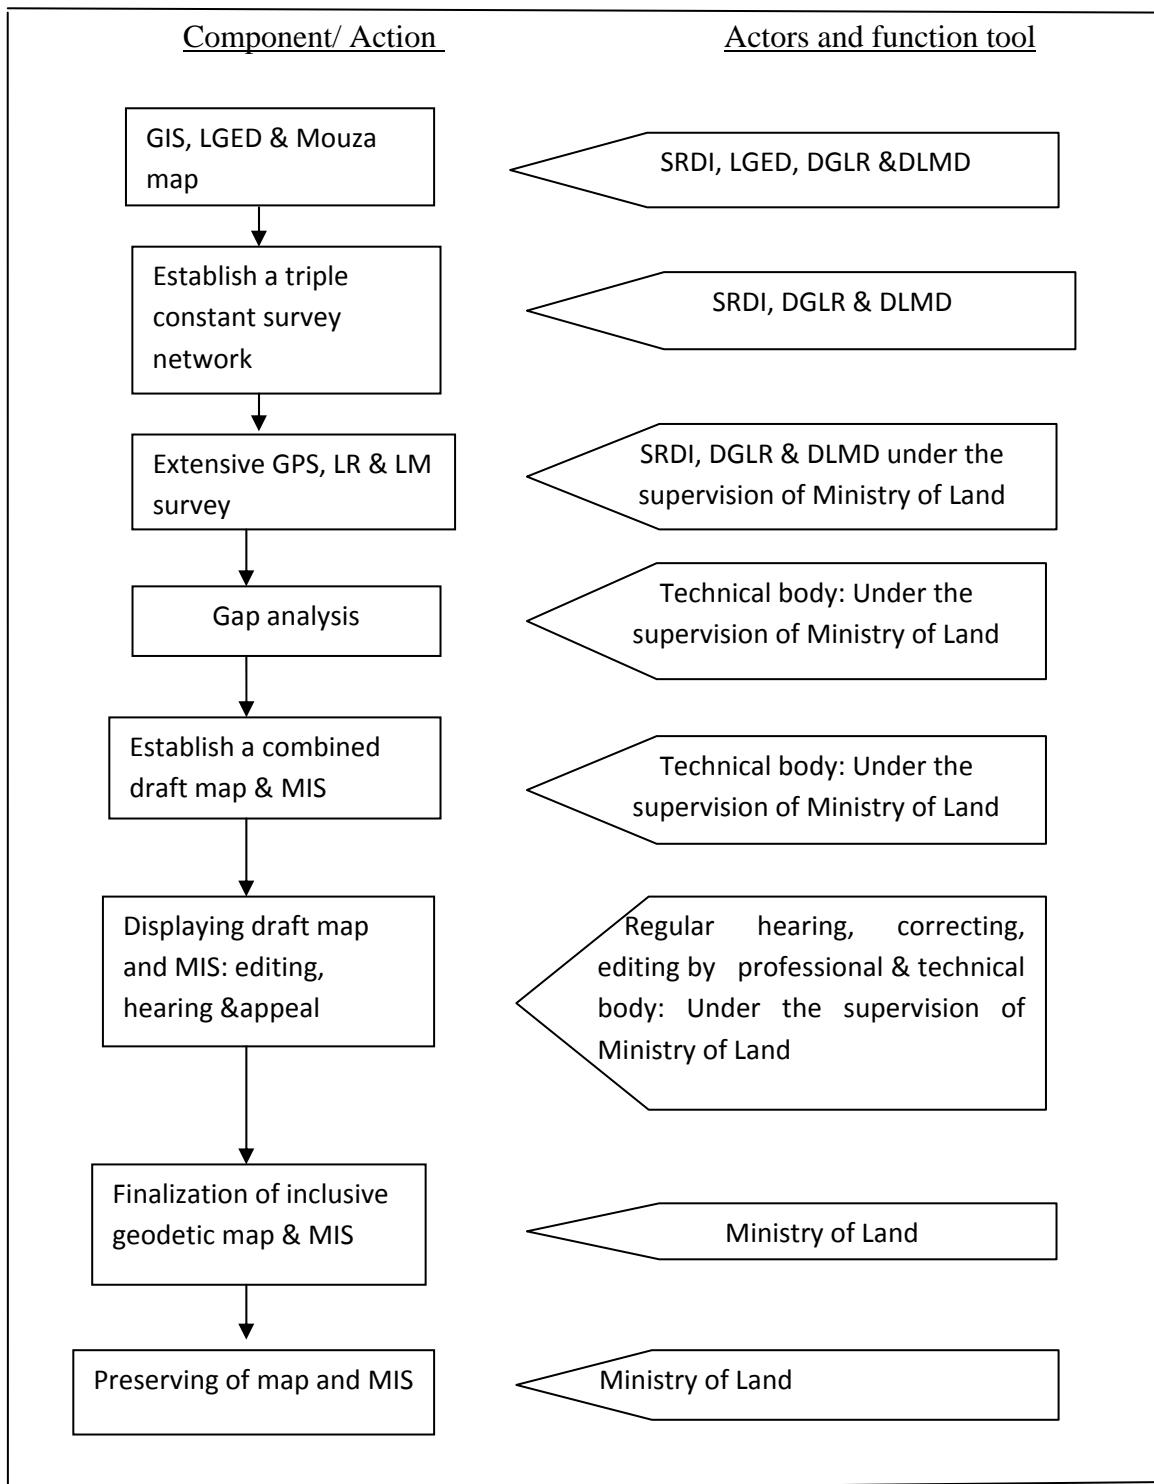

Figure 2.13: Steps for Structuring of CEUL map and MIS

Sources: Developed by Author, 2014

The design should be permanent and obligatory for all beneficiaries where punitive measure included. Secondly, the government will carry on a piloting selecting the suitable area for a period of time and analyze its each smallest-unit for further strategy whether it to be continued or not. Thirdly, depending on piloting, the government will formulate a countrywide policy for its compulsory implementation. In every steps of the process, the government must maintain good governance and ethical code of conducts

7.4 Identification of problem

The ministry of land is the sole authority to provide land related services to land owners, public and private agencies. Since, the population growth has been increasing and the land remaining unchanged. Besides, the use of cultivated and other land is declining and converting to other planned or unplanned use and government has no ownership right to control the land use of private property, it is high time and esteem need to think about the matter; otherwise, once people of this country will supper for their livings, breathing and feeding. In clarifying the real sceneries of Bangladesh, the government, first of all, will identify the problem and explain it's from every corner. Beside this, government must prioritize the issue in her policies for the benefit of much people and their future generation.

7.5 Need analysis

Needs analysis is defined as a formal process focus on how a system or model addresses the needs of much people. Need analysis of CEUL will not only use as tool, but also will be considered a valuable analytical technique to better gauge the acceptability of the model to much people. Since the main purpose of the CEUL needs analysis is the land owner's satisfaction and nation's urgency, it will focus on the goal and aspiration of rural people. It is said that the main occupation of the population of Bangladesh is agriculture that provides us agricultural goods, living means and factors of production. Cultivable land and riverine water is the important sources of human living means. So, the degradation and declining nature of land is not considerable to her inhabitants. Restoring and utilizing the cultivable land with efficient manner is the essence of country's people. It is also stated that the main occupation is not transformed into other until alternative sources of living means developed, so we cannot think to decrease the use of agricultural land.

7.6 Ex ante impact assessment

Impact assessment of the CEUL will be used as a relatively tools for decision making that involving a standardized set of procedures designed to evaluate the prospective impacts a planned measure on land use, benefits etc. It should be deemed too great to justify a particular area. Impact assessment will be typically located at the center of the most contentious public policy decisions, involving difficult tradeoffs between nature, society and economy. What are the cumulative social and economic impacts from a new system, and do the people in the local area have to tolerate the negative effects for the economic benefit of the rural area as a whole? What kind of preventive measures are needed before the new system develop becomes acceptable to the vulnerable people? The results of IAs are often challenged in court and, even if this is not the case. IAs will provide starting points rather than final answers or solutions to contentious public policy debates. For the betterment of the inhabitants of Bangladesh, it is essential to analyze the present value of land utilization and her impacts in the socio-economic and environmental concern. With considering the present value and impact, the future impact assessment tools like cost benefit analysis, SWOT analysis, value chain methods, IRR, value for money, EIA, sustainability etc. need to be considered by the government.

7.7 Analyze the GIS, LGED and mouza map

Gap analysis compare actual model performance with ideal performance, will be used in conjunction with needs analysis to make best potential use of the model. It will try to fill the gap between where the system is, and where it aims to be. The GIS map (which explain the present land use pattern for a specific area), LGED map (which explain the geographic structure of an area with details including matter) and mouza map (which explain the land class, scheduled, ownership etc) will analyze for conjunction of efficient land use and finding gap for further steps. By filling up gaps will make a unique standard map for planning and zoning.

7.8 Piloting

A pilot experiment is a small scale preliminary study that will be conducted in order to evaluate feasibility, time, cost and unfavorable events of the CEUL model for predicting appropriation and improving upon the design for full-scale project. In this stage government will conduct a pilot project in a specific area where every character of land use is available to examine and information is at hand to clarify the system. During piloting, the government will examine from

each corner of the project. Government will find weakness and positive site of the project for its further action.

7.9 Awareness buildup

Public awareness can be part of CEUL approach to prevent unplanned land use and to protect agriculture land. From building awareness it is an opportunity to share resources and information on and educating the public and creating rural to urban community support and partnerships to prevent and protect agriculture land. The system will implement for people need to inform them and invite into the process. Second sector (private organization) and third sector (NGO), local stakeholders, land owners, national and international expertise, professional bodies, advocates, member of law and enforcement agencies, security forces, intelligences, beneficiaries need to adjust with the system so that the system can be more participatory to make it sustained and people oriented. During the people and professional participation, the good and bad effect of the system needs to analyze for its acceptability to the people. Social media networks can be a key avenue for sharing messages and educating the public about the importance of efficient land use management.

7.10 Draft MIS

A management information system (MIS) will prepare to preserve and to provide information efficient and effective way using digital device by government procedures. After figuring out of different types of map and information, a consolidated draft digital map with latest reliable information system need to make for the primary shape of the system. This map and information will use as primary facts and pillar of the MIS system. From different segment of the MIS, it will use as the networking tool among various component and also consolidate the information together. The information will be used to analyze and facilitate strategic and operational activities of the system. Compilation of information for the system from a wide range of sources to support problem solving and decision making will bring they whole system together and competent. It will be used as a reporting tool that provides quick access to summarized reports coming from all levels such as local, urban sectors.

7.11 Stakeholder's engagement

In this stage, stakeholder engagement need into all the stage of the MIS by which government involves different types of people who may be affected by the processes it makes or can influence the implementation of its decisions. They may support or oppose the decisions. A number of meeting, seminar, workshop, public gathering need to conduct during any period of the system where all types of stakeholders, civil society, land specialists, land owners, professional bodies may attend to make it more fruitful and effective.

7.12 Ground truthing

Ground truthing refers to information collected on location. Ground truth allows image or statistical data to be related to real features and materials on the ground. It helps to determine the accuracy of the information, map and other secondary information. In this ground truthing stage, the government with the assist of professional and technical hands will collect data from field and with the help of satellite images.

7.13 Stakeholder's reengagement

For the purpose of redefine the MIS process, after gathering data and images from the ground level, the rearrangement of stakeholders including civil society will fill up the gap between governmental procedure and public acceptance.

7.14 Editing/Modifying and Finalizing of MIS

After engagement of stakeholders in the MIS process, by their suggestion and recommendations may be supplement some modification with addition and subtraction of the system that will make the system more reliable and holism. With a view to making a management information system of the process, the gathering data need to be finalized for preserving and dissemination of them into a public and private spare.

7.15 Preserving and disseminating IS

All data should be stored in a centralize process with the technical support of professional body so that during the need that can be collected or used as an informative tools for the construction of the process. For the awareness build up, from central to local community, the MIS should be

disseminated through scattering, advertising, announcement, broadcasting, publishing to the public. MIS should be digitalized and accessible to all for knowing and updating information.

7.16 Policy formulation

After finishing the piloting with MIS and public awareness and their acceptance into the model, and the active fruitful technological support the project achieved its goal and aspiration, the government will consider for administrative mechanisms, means policy formulation, that will be arranged to reach explicit goals. In the process of policy formulation, national and international think tank, professional bodies, technical hand, specialists, elected and appointed officials, research organizations, law enforcing agencies, intelligence, interest group, public representatives, media etc. should be engaged for accepting their valuable suggestions and analysis. After that, the policy should be executed in the ground level with different layer like regional, local central etc with implementing authorities. The implementing authority should be formed participating special agencies whose must have technical knowledge, authority to handle the system etc. There should be a supreme authority for taking contingency of subordinate responsibilities. Close monitoring and evaluation system should be ensured the better performance and gap analysis between the ideal policy and practical implementation. In considering the public thinking, practical procedure, time and innovation, technology, globalization and so on, the policy should be modified with optimal adjustment or incremental adjustment by the government. During the implementation, nodality, treasures, persuasion and services must be ensured to make the system functional and fruitful. The policy should be compulsion for all so that nobody can avoid, skip or violate it for a single motive and no evil motive can compel to make it inactive. Punitive measure for violating role must be complied for stopping the severity of unplanned land use, remaining cultivable land water and forest as well as environmental sustainability.

7.17 Ethical code of conduct

The pillar of good governance accountability, transparency, responsive, participatory, rule of law, effective and efficiency, equitable and inclusiveness features must be followed to run the CEUL model more fruitful and sustainable. The process of implementation may be hampered by unethical evil motives and for these zero tolerance will be played in the whole process. The

implementing authority must face the supreme authority and criminal court for their misdeeds and evil activities. Some other punitive measures should be taken to punish them if found any engagement in the illegal process or activities. Besides, governmental autonomous body like ombudsman, Anti Corruption Commission, constitutional bodies may take necessary action against the authority or persons if found any engagement with malfeasance responses.

7.18 Future use of the CEUL

The CEUL is a model that allows people to test the probable impacts of changes in unplanned land-use to compulsory efficient use, thereby providing policy makers with a way to assess the impact for policy/regulatory changes on the competent use of land. It may and should also be used to set goals for future land use efficiency and to monitor progress over time. It may use every specific region, district, Upazila, union and village level without declining agriculture land using in a planned way so that the people and environment would not go beyond of acceptation of human being as well as the government. . It may also be extended to other issues related to land use, such as environmental planning, watershed analysis, brown field redevelopment, or the management of public utilities.

Chapter 8: Recommendations

In order to ensure efficient and planned land use for saving agriculture land, forest area and water from human and natural interventions, some fundamental planning and policy are necessary. In this regard the following recommendations need.

Implementation of CEUL model

The whole country can be incorporated in the CEUL model with the active participation of first, second and third sector through digitization of land maps and management information system towards formulating policy. The policy maker may consider the structure and detailed work (Figure-2.12) of the model. After enacting the planned land use policy, the compulsory imposition may be ensured to stopping haphazard land utilization in every spare of this country. The CEUL model may save cultivated land, forestry and natural open water from unplanned utilization. The CEUL model may be used as implementing instrument of public policy in order to regulate land use in an efficient way.

Zoning policy

It is high time to formulate a zoning law for the agrarian based country like Bangladesh. Village should be the unit for implementing land use zoning policy. After preparation and approval of zoning map, nobody will be allowed to change without specific purpose and prior permission from the central government. Zoning map prepared by the land ministry, local government institution must follow as implementing agencies. For the implementation of zoning map and MIS, local government must strengthen by knowledge, skill and commitment.

Use based zoning of land

The local government institutions, like city corporations, municipalities, and Upazila porishod should be entrusted with the duties and responsibilities with policy. Zoning policy must be implemented effectively by the local government. No changes should be made in the zoning maps unless approved by competent authority. However, in unavoidable circumstances, the authority may consider for transformation of land class.

Restriction of arable land

Existing arable land, as far as possible, should be restricted and not used for other purpose. Policy should be made for use of cultivable land for nonagricultural purpose. Recourse against the violator must be mentioned mandatorily in the policy.

Vertical use of land

In most cases, land owners, purchasers etc construct their homestead horizontally in Bangladesh that is miserable for declining of arable land, environment and clumsy picture. Once the land converted to others will not possible to return earlier features. In these cases, the compulsory of vertical land use pattern can be remaining the cultivated land from declining and degradation. Subdivision of holdings and plots should be restricted to a reasonable limit for mechanization of agricultural farming for productivity. Zoning policy including CEUL model may assist to rectify the presence horizontal system to vertical use.

Optimum use of land resource

Everywhere in the country residential, commercial, industrial, tourism and infrastructure etc purposes excess lands are used whether optimum land use can make all the development aspect more efficient. Optimum and planning use can ensure to utilize all unused land in Bangladesh.

Economy of land acquisition

In most cases, while going for acquisition of land for development projects and other activities, the amount of land required for the purpose is not determined with austerity. Consequently, a large amount of acquisitive land has become useless for cultivation. The unplanned use and misuse of the acquisitioned land is also quite common. Huge portion of land acquisitioned at various times for different development projects is now left either unused or is used for unproductive purposes. To evade these cases, fertile cultivable should be avoided for construction of roads and highways and implementation of other development projects. Minimum requirement of land should be determined before an acquisition proposal for any development project is submitted.

Designed homestead

Construction of designed homestead and multi-storied buildings should be encouraged both in rural and urban areas in view of the optimum utilization of land for the purpose of housing. Construction of model houses in rural areas should be encouraged

Conservation of forest

The areas once declared as forests by the authority should be preserved forever. Initiatives should be taken for proper maintenance, preservation, and extension of existing forest areas. Programs should be taken for effective preservation of afforestation. Planned agro-forestry would let households manage land according to their particular needs for food, fuel, livestock and other resources.

Preservation of water bodies

Existing water bodies must be preserved and should not be filled up. The responsibility of preservation, maintenance, and re-excavation should lie on the individual owners in case of privately owned ponds/tanks. In the case of large water bodies like rivers, canals, lakes, haors, baors, etc. this responsibility should be on the government and the users. All these water bodies should be properly utilized for fish culture scientifically.

Digitization of whole process

For the best and planned use of land and her resources, the digitization of land information with graphical presentation is the demand of time of country's people. The digital information can make the whole system more simple and easy to receive service from government.

Good governance

All activities with good governance can ensure the people's satisfaction and social justice. In activation every process without good governance, the system will come into vein and go to astray and thus society will not be benefited.

Punitive measure

In the policy, there should be a provision for the violators. All activities should be evaluated and judged by public account committee, internal external auditors, ACC, ombudsman, court, government bodies and so on.

Inter agencies cooperation

Inter-agencies cooperation and coordination should be obliged to make the policy implementation process more effective and fruitful.

Awareness building

To make the land use system more plan wise, the dissemination of information into ground level is important to aware the local beneficiaries as well as engagement of civil societies, NGO's, professional bodies and other agencies.

Strategic plan

The government can make plan to continue the policy for a certain period until its output and outcome. After that, government can modify or make incremental adjustment for its sustainability.

Politics

The political will can make the system more fruitful. Visionary political leadership can only ensure such people centric and commitment oriented plan for the development of Bangladesh.

Conclusion

Land is more vulnerable natural resource and it is easily affected by human factors. Land misuse and mismanagement can be derived from human factors in many ways. The contamination, destruction and reduction of land affect on her character, structure, quality and capacity. The current land use guiding principle of Bangladesh is unable to conduct the increasing demand. National land zoning project is a tool for initiating and implementing the planned use of land. For assessing the land to its best possible use, the core aims of the project is to prepare digital zoning map and to develop land zoning data base and management information system that will prevent land degradation, preserve and protect eco-system and reduce land conflict. Though the land zoning project has been carrying out since 2010, it cannot stop present unplanned use of land due to not formulating policy and their implementation. Beside this, the project doesn't work from holistic view point. As a result, various gaps between real grounding and documentation of the MIS of the project have been identified from the study. With this end, for the sustainable and planned development of land use system of Bangladesh, country wide, it is essential to formulate a holistic approach. Compatible and efficient use of land is inevitable for Bangladesh. Compulsory Efficient Use of Land (CEUL) is the realistic methods for escalating ample land use for sustainable development of Bangladesh.

Masters of Arts in Governance and Development (MAGD) Program Institute of Government Studies (IGS), BRAC University, Bangladesh

(On 3rd March, 2014 the study arranged a focus group discussion (FGD) with local stakeholders. List of the stakeholders and their individual comments in the FGD are given bellow)

A Study on the pattern of landuse change and agriculture land transformation in Bangladesh: Questionnaire/topics:

[The present study is an attempt to study the pattern of landuse change and agricultural land transformation. The research also will analyze the present land zoning process in Bangladesh. I am a student and researcher of MA in Governance and Development, Institute of Governance Studies, BRAC University. The study is being undertaken for partial fulfillment of the requirement of a Masters Degree in Governance and Development. I request you for helping me to collect some information. Your information will be used for my academic research. All kinds of cooperation from you will be highly appreciated.]

1. Land zoning project and present zoning awareness
2. Importance of the union
3. Occupation
4. Agriculture
5. Soil condition
6. Natural and man-made disaster
7. Fisheries
8. Forest
9. Population
10. Industry
11. KPI
12. River bank erosion
13. Life style
14. Sairat mohal
15. Family , kinship
16. Income sources

Annexure-6.1

Interpretation on land use, zoning, demography, socio-economic condition etc.

The FGD focused all the relevant matters of land use, zoning, demography, socio-economic condition, regarding the research. It was carried out before the union office. In the FGD, all classes of stakeholders including businessmen, farmers, school teachers, religious leaders, NGO and public representatives as well as members and chairman of the union council were present. The summary of focus group discussion (FGD) and public consultation:

Picure of Focus Group Discussion (FGD) with local stakeholders

1. Main point was that government took major portion of land for acquisition purpose for Asuganj fertilizer industry, river port, silo, power plant, GTCL, Petrobangla, Abdul Halim rail bridge, compress house of titas and bakhra bad, Vhairab bridge. As a result, the area of agriculture land declined and occupation of farmland transfer to others.
2. The Government should prioritize other occupation in exchange of agriculture and it should be industrial and commerce basis. Since, the area became exploiting as commercial and industrial use it is urgent need to take initiative for new thinking for

development. They said that after few years there will not remain any agriculture land for cultivation and people will not willingly work on cultivation due to less profit.

3. Local people are aware of environmental concern and for that they want to raise their voice against environmental degradation. Sound and vibration of fertilizer industry and power plant should be under accepted level by installing good and of best quality equipment.
4. Discharging of hot water and digging of artificial canal of power plant and fertilizer industry damages breeding natural fish varieties (viz Taky etc) of charchartala union.
5. Due to deforestation, urbanization and sound pollution birds left from the plant site area.
6. Due to rapid urbanization of the study area and grid line, plants, herbs and bushes have been reduced.
7. The quantity of agricultural crops produced in the area is not satisfactory. Local farmer cannot meet their daily and yearly demand from those crops. This is why they changed their occupation and engaged nonfarm activities specially, industry, rice mill, day labour and so on.
8. Main crops are paddy, brinjal, tomato, sweet potato, and nut. People import rice from other portion to meet their demand. This area is not self-sufficient for agricultural crops.
9. Soil fertility is not up to the mark. During rainy season, when flood occurred continuously in every year, the water of the River Meghna and flood water usually carried out silt. The agriculture land was covered with siltation which was in favor of soil fertility and crops production. Now days it is not occurring and for that the soil of this agriculture area is infertile.
10. Main disaster is drought. During droughts, deficiency of water supply from natural rainfall is the new features in this area. Drought is lasting for one to two months each year which damage agriculture crops, ecological balance and so on. Other disaster is yet to find and the trend of arsenic is minimum that is not consider to measure.
11. There is no reserve forest, community forest, government forest area. Local people planted some homestead forest surroundings their house and residents.
12. The area is suitable for catching fish. The river Meghna flow three side of the union which carries natural revering flora and fauna for biological sustainability. But, unfortunately, due to commercial use of land and changing profession, the number of

fisherman decreasing day by day. The river Meghna, few ponds and two open Jalmahal (open water bodies) to be used for catching fish.

13. Population is controlled and not increasing as country trend. People are very much concern about their life and future.
14. Ammonia is harmful for agriculture, fisheries, and ecology. Living people suffer for the ammonia when it comes out from fertilizer industry to the outside. The living animals die and ecology face problem. All fishes die.
15. Seven Key Performance Indicators (KPI) are located in the area which are Asuganj fertilizer company, power plant, GTCL, silo, Vhairab bridge, rail bridge, land port. So, the place is very much important for the country of Bangladesh.
16. According to the upazilla agriculture office, the charchatla union has 36 boiler based rice husking mills. A large number of man and woman labors work in mills. They work from seasonal basis and contacted with the whole process of boiling. Paddy come from different part of the country and process here for making rice then transfer for sell and business. They come from adjacent low-lying and haor areas. Educated go to the capital city.
17. Rice mill businesses, contractors, are the main occupation of the people of this area.
18. Foreign remittance is high especially for technical labor. During the construction of fertilizer industry, power plant, Vhairab Bridge and other KPI, the local potential people worked in those construction process and build up capacity in technical knowledge. With those knowledge most of them went to abroad and worked in mill and industries with a higher demand and standard salaries. In resulting, they earn sufficient foreign currency from abroad.
19. Fish breeding and the flora and fauna of the area should be saved.

**Masters of Arts in Governance and Development (MAGD) Program
Institute of Government Studies (IGS)
BRAC University, Bangladesh**

A Study on the pattern of landuse change and agriculture land transformation in Bangladesh: Unstructured questionnaire:

[The present study is an attempt to study the pattern of landuse change and agricultural land transformation. The research also will analyze the present land zoning process in Bangladesh. I am a student and researcher of MA in Governance and Development, Institute of Governance Studies, BRAC University. The study is being undertaken for partial fulfillment of the requirement of a Masters Degree in Governance and Development. I request you for helping me to collect some information. Your information will be used for my academic research. All kinds of cooperation from you will be highly appreciated.]

Part A. Informant's basic information

1. Name:
2. Designation:
3. Address:

PART-2: Research related information

1. What do you mean by land zoning?
2. Is the project working for preparing zoning or preserving cultivated and other land?
3. What are the basic differences of objectives of zoning in developed countries and Bangladesh?
4. What are the basic elements or tools of zoning project?
5. How the land zoning save our agriculture land?
6. Will the government consider making a policy regarding zoning?
7. Does the zoning project cover the whole area of the country?
8. Is there any effect of zoning where the project completed?
9. What should be happen to landless or poor farmer those have only a single part of land and will not permit to change after zoning process?

10. Do you think the zoning system will be accepted by people in the country whether the coastal land zoning policy could not implement?
11. Do you think the engagement of civil society, stakeholders, beneficiaries etc. is insufficient to make the system more participatory and risk free?
12. How the government will take strategy to mitigate litigations of various problems regarding zoning?
13. How the zoning system will implement in the country?
14. What should be the punitive measure for violating the laws while implement?
15. What is your responsibility in the project?

Appendix-7.1: Comments of KII on land use and zoning

S.N	Name of Key Informants & Designation	Photograph	Comment
01	<p>Md. Muazzem Hossain Ex-Project Director Additional Secretary Ministry of Land Phone (o) : 9540137 E-mail: addionalsecretary@minland.gov.bd hossainmuazzem@ymail.com</p>		<p>The project was started to save agriculture land from unplanned use and it was stopped for some days on account of ‘Arial bill’ chaos and government decided that zoning may create some effect on human rights. Because people will not permit to use their own land in spite of their freedom. Over all, the zoning system must save our nations from danger zone to sustainable use of land</p>
02	<p>Md Abdul Hay Ex-Project Director (Joint Secretary) Director, BCIC abdulhyebcs@yahoo.com</p>		<p>Land zoning is a new concept for Bangladesh. Expanding utilization of land and her tremendous pressure on population, food, and environment demanded the zoning policy. Zoning does not ensure the planned land use like developed countries or resistance of present land management rather than it influence mass people to utilize land in efficient ways. Zoning does not make plan for planned urban or village area rather than it insist people not degrade and destroy cultivated land for the next generation. After completion of the project, the government will make a policy for country wide and preserve its data centrally for instituting storing tools.</p>

03	Mr. Md. Shahadat Hossain Project Director (Joint Secretary) of land zoning project, Ministry of Land Cell-01731080154 E-mail: pd@landzoning.gov.bd		Newly appointed
04	Sakhwat Hossain Sr. Land use Planner Land Zoning Project Ministry of Land Cell- 01716017965 E-mail: sakhawat@landzoning.gov.bd		<p>Land Zoning is the demarcation of geographic areas with specific combinations of properties or features used as per criteria only.</p> <p>Local government especially Upazila porishod, as an ownership of government authority, will implement the land use plan based on their socio-economic condition. The local authority will rule there are based on policy and for these the government will strengthens the local body appointing professional and technical expert.</p> <p>First of all, the project is examining for specific area than prepare some maps based on land topography, suitability, crop suitability, environment, riverine, forest condition etc. by the assistance of GIS, LGED map and ground truthing. Then the area identify as a specific preservation or zone area.</p> <p>The project of zoning will make countrywide map and handover to the government for their implementation through formulation a policy.</p> <p>Presently, the project carrying out district level workshop and started work with the help of local</p>

		<p>administration.</p> <p>The project disseminates up to union level. The project does not make a new map, it identify the agriculture, forest, fishing, urban, tourism, industrial etc. zone within the combined map of GIS and LGED map.</p> <p>The project is not going for details and for that it does not included the whole thing like mouza maps, demography, socio-economic conditions and so on.</p> <p>The zoning map can be used as planning tools for the government.</p> <p>From the projects and its output and recommendations agriculture land will be saved, environment will be protected, land use conflict will be dissolved and finally agro-fisheries-forest base country like Bangladesh will shape a wealthy nation with sustainable development.</p> <p>The developers, land grabbers, evil person may hamper or make resistance of the implementation of the project, but in considering the better future of the country the awareness and participation of all stakeholders can make system more fruitful.</p> <p>The farmers want to implement the project for saving their cultivated land from land grabbers and developers in the semi-urban and rural areas.</p>
--	--	--

	Nazrul Islam Team leader Land Zoning Project Ministry of Land		<p>The project works for rural zoning because urban zoning implemented in developed countries. Our zoning objectives are different from them. Our cultivated land is declining day by day for non-agriculture use. We are using satellite image for primary land use pattern. The policy will formulate for the countrywide so that unplanned land use could not hamper the living environment of the next generation. We are working for ground truthing for the validation of GIS, since the satellite images are previous or old. We may find crops in GIS map but during ground truthing, the place can be found as fallow due to time dynamic. The main function is to demark of land based on topography, use and sustainability. The decision will implement by the local authority after consolidation of maps and formulation of policy. We also declare some mixed area considering various characteristic of land use. We are not discouraging development but imposes rational and planned development.</p>
05	S M Atikullah Agriculture Specialist land zoning project, Ministry of Land		<p>The agriculture study of zoning project is very specific. We are gathering information from agriculture department of Upazila and correlate them with the GIS map and suggest the area whether it can declare as agriculture land or not. We also test soil and crops suitability and land types of a union level. Finally submit data to the land authority to further action.</p>
06	Md Mahbubur Rahman GIS & Remote Sensing		<p>GIS maps are used for land use and compare to ground truthing for zoning of land. Most cases</p>

	Specialist land zoning project, Ministry of Land		latest GIS map cannot use due to getting update map.
07	Sondip Kumar Singha Upazila Nirbahi Officer Asuganj, Brahmanbaria Telephone: 08528-74522 Mobile: 01780072277 E-mail: unoashuganj@mopa.gov.bd		The land zoning will save agriculture land from unplanned use. The zoning may help to use the all types of land in a systematic way. The public and private acquirement may consider the zoning law. The local authority will empower by this policy and impact of planning of an area will be taken into consideration by zoning. The people's awareness must be considered to reduce any barricade from them and planning use of land is mandatory for the country like Bangladesh.
08	Akterunnesa Assistant Commissioner (Land) Asuganj, Brahmanbaria Telephone: 0852-874003 Mobile: 01718906409 E-mail: rupanta6@gmail.com		The Charchatala union has rapid change from cultivate to semi-urban area last few decades. The people of the area do not consider the existing law for converting their land from agriculture to other use.

09	Md Rafiqul Islam Surveyor, AC Land office Asuganj, Brahmanbaria Mobile: 01925202420		After the SA operation the area changed rapidly and the government acquisition for KPI, most of cultivated land was used and for that the agriculture land decline with a large area.
10	Abdur Roshid Sub-Assistant Settlement Officer Brahmanbaria Mobile: 01717650361		The area of Charchartala will fill up within short time due to governmental development project and transformation of profession of local people of that area.
11	Md Hafizur Rahman Draftsman Settlement Office, Brahmanbaria Mobile: 01191584764		Engaging in the BS survey process it can be said that after few years the area will cover urbanization and development activities. No agriculture land will find for cultivation.
12	Juel Rana Agriculture Extension Officer Upazila Agriculture Office Asuganj, Brahmanbaria Mobile: 01716017856		The product of agriculture crops is declining year after year due to decreasing nature of crop land. Land developers and businessman are bringing top soil of fertile land as a result a number of crop land are remaining fallow. Besides these, many species of crops are not produced today due to most cost and less output.
13	Narayan Chandra Das Sub-Assistant Agriculture Officer Asuganj, Brahmanbaria Mobile: 01813154520		Once upon a time, the area was full of paddy and seasonal crops. Today, limited number of crops to be produced in charchartala union. Due to loss, farmers changed their crops pattern in umber.

14	<p>Md Sohidul Islam</p> <p>Upazila Fisheries Officer</p> <p>Asuganj, Brahmanbaria</p> <p>Mobile: 01716664756</p>		<p>Due to file up the swamp, ditch and watering area the fishes don't have any place for living, breathing and hatching. Likewise, the poisoning and wastages of industries goes to the watering area and kill them dramatically. The ammonia of fertilizer industry kills the surroundings fishes every month of the area.</p>
